Sterol Biosynthesis Inhibitors and Anti-Feeding Compounds T. Kato, 1986 Living organisms are separated from the outside world by their membranes which perform important roles for maintaining their lives Sterols are indispensable components in eukaryotic organisms for stabilizing membranes composed of phospholipid bilayers Most prokaryotic organisms on the other hand do not contain sterols in their membranes although recent studies indicated that the bacterium *Methylococcus capsulatus* produces sterols 1 and many strains of *Mycoplasma* bacteria without cell walls require sterols as an essential growth factor 2 Some bacterial species synthesize hopanoids which are hypothesized to function like sterols in eukaryotic organisms 3 Significance of ergosterol in fungi has been recognized from the fact that the yeast *Saccharomyces cerevisiae* requires ergosterol for growth when cultured in a strictly anaerobic condition 4 Electron microscopic studies showed that membrane structures disappeared in the yeast grown anaerobically without a supplement of ergosterol 5 6 indicating the necessity of ergosterol for membrane biogenesis Further confirmation of the significant role of ergosterol in the membranes was derived from the studies on polyene antibiotics In the presence of polyenes such as nystatin filipin and amphotericin B fungal cells lose selective permeability of the membranes since polyenes interact with ergosterol such that the structure of the fungal membranes is disrupted 7

Controlled Release, Biochemical Effects of

Pesticides, Inhibition of Plant Pathogenic Fungi, 2012-12-06 Since the middle of the Sixties new types of formulation for biologically active compounds have been developed which have been introduced into the literature under the term Controlled Release Formulations CRF Stimulated by results from former and successful pharmaceutical research which was engaged in the production of preparations with protracted effects introduction onto the market in the year 1952 of D amphetamine in the form of pellets coated to varying degrees with fats and waxes 1 experiments were carried out to transfer the prolongation of effectiveness to pesticidal substances also by means of a depot formulation Initial work was concerned with the production of protective coatings for sonar systems in marine ecosystems By means of antifouling paints or rubber coatings containing tri n butyl tin oxide TBTO the growth of marine organisms on sonar domes buoys and hulls in the water could be effectively prevented 2 3 Controlled release formulations of pesticides are defined as depot systems which continuously release their toxic constituents into the environment over a specified period of time usually months to years 4 According to this definition such formulations can be successfully employed where a chronic exposure to biologically active compounds is required over a longer period The following hypothetical example is intended to illustrate this 5 In Fig 1 the duration of activity of a non persistent pesticide with a loss rate under environmental conditions of t1 2 15 days is graphically illustrated

Sterol Biosynthesis Inhibitors Dieter Berg, Manfred Plempel, 1988 Bioactive Heterocyclic Compound Classes Clemens Lamberth, Jürgen Dinges, 2012-08-14 The chemistry of heterocycles is an important branch of organic chemistry This is due to the fact that a large number of natural products e g hormones antibiotics vitamins etc are composed of heterocyclic structures Often these compounds show beneficial properties and are therefore applied as pharmaceuticals to treat diseases or as insecticides herbicides or fungicides in crop protection This volume presents important agrochemicals Each of the 21 chapters covers in a concise manner one class of heterocycles clearly structured as follows Structural formulas of most important examples market products Short background of history or discovery Typical syntheses of important examples Mode of action Characteristic biological activity Structure activity relationship Additional chemistry information e g further transformations alternative syntheses metabolic pathways etc References A valuable one stop reference source for researchers in academia and industry as well as for graduate students with career aspirations in the agrochemical chemistry

Target Sites of Fungicide Action Wolfram Koeller, 2018-01-18 Target Sites of Fungicide Action presents a critical examination of the mode of action of antifungal inhibitors especially the mechanistical aspects of agricultural fungicides and antifungal drugs It provides an interdisciplinary approach through its discussions of inhibitors with target sites in sterol biosynthesis molecular studies in fungicide research and fungal resistance Researchers and students in plant pathology mycology and medicine will find this book to be a comprehensive summary of current knowledge as well as a source of stimulation for future research in the field of applied mycology
