

## Fungi 1 - Rhizopus

The basic structural features of fungi are not cells but **hyphae**. Hyphae are microscopic branching threads. Each thread consists of a tube formed from a wall enclosing cytoplasm and a vacuole. The hyphal walls are not made of cellulose but of a substance called **chitin**, an organic nitrogenous compound. The hyphae contain many nuclei distributed throughout the cytoplasm. Sometimes the hyphae are divided into compartments by cross walls.

Diagram of a section of a hypha

(5μ is 5 thousandths of a millimetre)

The fungi do not have chlorophyll so they cannot make their food in the way that plants do. They feed on dead or decaying organic matter and are classed as **saprophytes**. Their hyphae penetrate the dead material and form a branching network called a **mycelium**.

The tips of the growing hyphae produce enzymes which digest the organic material. The soluble products are absorbed into the hyphae.

When mould fungi, such as *Rhizopus*, grow on stale bread or rotting fruit, the mycelium can be seen as a greyish 'fuzz'.

**Rhizopus** is a mould fungus which grows on stale bread or rotting fruit. It reproduces asexually by sending up vertical hyphae, each of which swells at the tip to produce a **sporangium**. The cytoplasm in the sporangium divides repeatedly to produce a mass of **spores**, each with a nucleus. When the sporangium breaks open, the spores are dispersed in the air, and each can grow to form a new mycelium if it lands on suitable material.

There is also a sexual method of reproduction.
