- i. **Organ**: A structure made of tissues that performs a specific function in the body. Examples include the heart, lungs, and stomach.
- j. **System**: A group of organs that work together to perform a specific function. Examples include the digestive system, circulatory system, and nervous system.

2. **Explain the following processes:**

- a. **Protein synthesis**: The process by which a cell uses the instructions in a gene to make a protein. It involves two main steps: transcription (making an mRNA copy of the gene) and translation (using the mRNA to assemble the protein from amino acids).
- b. **Cell division**: The process by which a cell divides into two daughter cells. There are two main types: mitosis (for growth and repair) and meiosis (for reproduction).
- c. **Metabolism**: The set of chemical reactions that occur within a cell to convert food into energy and build the molecules needed for the cell to function.
- d. **Signal transduction**: The process by which a cell receives and responds to signals from its environment. This involves a series of steps, including the binding of a signal molecule to a receptor, the activation of a signaling pathway, and the production of a response.
- e. **Gene expression**: The process by which a gene's instructions are used to make a protein. This involves the transcription of the gene into mRNA and the translation of the mRNA into a protein.
- f. **Cell differentiation**: The process by which a cell becomes specialized to perform a specific function. This is achieved through the expression of different genes in different cells.
- g. **Immune response**: The body's defense system against foreign invaders (pathogens). It involves the activation of immune cells, such as white blood cells, which can recognize and destroy pathogens.
- h. **Homeostasis**: The process by which the body maintains a stable internal environment. This involves the regulation of various factors, such as temperature, blood sugar, and pH.
- i. **Reproduction**: The process by which a new organism is produced from its parents. There are two main types: asexual reproduction (involving one parent) and sexual reproduction (involving two parents).
- j. **Development**: The process by which an organism grows and changes from a single-celled zygote into a complex, multi-celled organism.

- a. **Nucleus**: The control center of the cell, containing the DNA and the nucleolus. It is surrounded by a nuclear envelope.
- b. **Mitochondrion**: The powerhouse of the cell, where energy is produced through the process of cellular respiration. It has a unique structure with a folded inner membrane.
- c. **Endoplasmic reticulum**: A network of membranes that is involved in the synthesis and transport of proteins and lipids. It is divided into rough ER (studded with ribosomes) and smooth ER (lacking ribosomes).
- d. **Golgi apparatus**: A series of stacked, flattened sacs that are involved in the processing and transport of proteins and lipids. It acts as a sorting station for molecules moving through the cell.
- e. **Lysosome**: A small, spherical organelle that contains enzymes for breaking down waste materials and cellular debris. It acts as the cell's recycling center.
- f. **Centrioles**: Two cylindrical structures that are involved in cell division. They are made of microtubules and are positioned at right angles to each other.
- g. **Plasma membrane**: The boundary of the cell, which separates the interior from the exterior. It is made of a phospholipid bilayer and contains various proteins and channels.
- h. **Cytoplasm**: The fluid-filled space inside the cell, where most of the organelles are located. It is composed of water, salts, and various organic molecules.
- i. **Extracellular matrix**: The network of proteins and carbohydrates that surrounds the cell. It provides structural support and is involved in cell signaling.
- j. **Cell wall**: A rigid, protective layer that surrounds some cells, such as plant cells and bacteria. It is made of cellulose or other polysaccharides.

4. **Discuss the following topics:**

- a. **The role of proteins in the body**: Proteins are essential for many functions, including building muscle, repairing tissues, regulating metabolism, and defending against disease. They are made of amino acids and can be found in many different shapes and sizes.
- b. **The importance of a healthy diet**: A healthy diet is essential for maintaining good health and preventing disease. It should include a variety of fruits, vegetables, whole grains, and lean proteins. Eating a balanced diet can help to keep the body's systems working properly.
- c. **The effects of stress on the body**: Stress is a natural response to a challenging situation, but chronic stress can have negative effects on the body. It can lead to high blood pressure, heart disease, and other health problems. Managing stress through techniques like exercise, meditation, and deep breathing can help to reduce its impact.
- d. **The benefits of regular exercise**: Regular exercise is essential for maintaining good health and preventing disease. It can help to improve cardiovascular health, strengthen muscles, and boost the immune system. Exercise can also help to reduce stress and improve mood.
- e. **The importance of sleep**: Sleep is essential for the body to rest and recover. It helps to regulate the body's internal clock and maintain a healthy balance of hormones. Lack of sleep can lead to a variety of health problems, including obesity, diabetes, and depression.
