The Origins And Rise Of Ethology:

The Origins and Rise of Ethology William Homan Thorpe,1979 *Reader's Guide to the History of Science* Arne Hessenbruch,2013-12-16 The Reader's Guide to the History of Science looks at the literature of science in some 550 entries on individuals Einstein institutions and disciplines Mathematics general themes Romantic Science and central concepts Paradigm and Fact The history of science is construed widely to include the history of medicine and technology as is reflected in the range of disciplines from which the international team of 200 contributors are drawn The Identity of the History of Science and Medicine Andrew Cunningham,2018-02-06 In these essays Andrew Cunningham is concerned with issues of identity what was the identity of topics disciplines arguments diseases in the past and whether they are identical with more usually how they are not identical with topics disciplines arguments or diseases in the present Historians usually tend to assume such continuous identities of present attitudes and activities with past ones and rarely question them the contention here is that this gives us a false image of the very things in the past that we went to look for The Oxford Companion to the History of Modern Science John L. Heilbron,2003-02-14 Containing 609 encyclopedic articles written by more than 200 prominent scholars The Oxford Companion to the History of Modern Science presents an unparalleled history of the field invaluable to anyone with an interest in the technology ideas discoveries and learned institutions that have shaped our world over the past five centuries Focusing on the period from the Renaissance to the early twenty first century the articles cover all disciplines Biology Alchemy Behaviorism historical periods the Scientific Revolution World War II the Cold War concepts Hypothesis Space and Time Ether and methodologies and philosophies Observation and Experiment Darwinism Coverage is international tracing the spread of science from its traditional centers and explaining how the prevailing knowledge of non Western societies has modified or contributed to the dominant global science as it is currently understood Revealing the interplay between science and the wider culture the Companion includes entries on topics such as minority groups art religion and science's practical applications One hundred biographies of the most iconic historic figures chosen for their contributions to science and the interest of their lives are also included Above all The Oxford Companion to the History of Modern Science is a companion to world history modern in coverage generous in breadth and cosmopolitan in scope The volume's utility is enhanced by a thematic outline of the entire contents a thorough system of cross referencing and a detailed index that enables the reader to follow a specific line of inquiry along various threads from multiple starting points Each essay has numerous suggestions for further reading all of which favor literature that is accessible to the general reader and a bibliographical essay provides a general overview of the scholarship in the field Lastly as a contribution to the visual appeal of the Companion over 100 black and white illustrations and an eight page color section capture the eye and spark the imagination The Animal-human Boundary Angela N. H. Creager,William C. Jordan,2002 An examination of the difficulties in fundamentally differentiating humans from all other animals The way in which humans articulate identities

social hierarchies and their inversions through relations with animals has been a fruitful topic in anthropological and historical investigations for the last several years. The contributors to this volume call attention to the symbolic meanings of animals from the casting of first year students as goats in medieval universities to the representation of vermin as greedy thieves in early modern England. But the essays in this volume are also concerned with the more material and bodily aspects of animal-human relations like eating regulations, aggression and transplanting of animal organs into human beings. Xenotransplantation. Modern biologists have increasingly problematized the human-animal boundary. Researchers have challenged the supposedly unique ability of humans to use language. Chimpanzees and gorillas, it has been argued, have learned to communicate using American Sign Language. In addition, some scientists regard the sophistication of modes of communication in species like dolphins and songbirds as undermining the view of humans as uniquely capable of complex expressions. As studies of nonhuman primates threaten to compromise the long held assumption that only humans possess self-awareness, the question becomes: How can one firmly differentiate human beings from other animals? Contributors include Piers Beirne, Richard W. Burkhardt Jr., Mary E. Fissell, Paul H. Freedman, Ruth Mazo Karras, Susan E. Lederer, Rob Meens, John H. Murrin, James A. Serpell and H. Peter Steeves. Angela N. H. Creager and William Chester Jordan are Associates of the Shelby Cullom Davis Center for Historical Studies, Princeton University.

Julian Huxley, Biologist and Statesman of Science C. Kenneth Waters, Albert Van Helden, 1992. Julian Huxley 1887-1975 was a man of many talents and enormous energy. At the beginning of his career he founded the Biology Department at Rice Institute where he taught for three years before going on to achieve eminence as a biologist, statesman and intellectual. While this volume concentrates on Huxley's contributions to field and laboratory biology, it also provides the first in-depth examination of his efforts to popularize science and to advance the human species through eugenics. The first part of the book

places Huxley in a broad intellectual context and offers an overview of his contributions to biology as they related to major developments in twentieth century evolutionary theory Huxley's biological work is investigated in more depth in the second part while the third examines him as a public scientist and takes a new look at his efforts to bring biology and its potential benefits to the community at large It is hoped that the book will spur further research into Huxley's religious and social views and his public role in science **Evolutionary Restraints** Mark E. Borrello, 2024-05-31 Much of the evolutionary debate since Darwin has focused on the level at which natural selection occurs Most biologists acknowledge multiple levels of selection from the gene to the species The debate about group selection however is the focus of Mark E Borrello's *Evolutionary Restraints* Tracing the history of biological attempts to determine whether selection leads to the evolution of fitter groups Borrello takes as his focus the British naturalist V C Wynne Edwards who proposed that animals could regulate their own populations and thus avoid overexploitation of their resources By the mid twentieth century Wynne Edwards became an advocate for group selection theory and led a debate that engaged the most significant evolutionary biologists of his time including Ernst Mayr G C Williams and Richard Dawkins This important dialogue bled out into broader conversations about population regulation environmental crises and the evolution of human social behavior By examining a single facet in the long debate about evolution Borrello provides powerful insight into an intellectual quandary that remains relevant and alive to this day **Philosophical Topics**, 1999 Vols for 1981 include the proceedings of the Southwestern Philosophical Society *Encyclopedia of Animal Behavior: A-F* Michael D.
