The Physiology Of Insecta Second Edition Volume V:

The Physiology of Insecta Morris Rockstein, 2013-10-22 The Physiology of Insecta Second Edition Volume I is part of a multivolume treatise that brings together the known facts the controversial material and the many still unsolved and unsettled problems of insect physiology Since the first edition of this multivolume treatise was published there has been a notable expansion of scientific endeavor in each of the various aspects of insect physiology The original three volume work has now grown to a thoroughly revised six volume treatise The present volume contains six chapters and begins with a discussion of the biology of the Insecta This is followed by separate chapters on the structure and origin of the female reproductive system the control of oogenesis semen production sexual behavior and oviposition physiological and biochemical changes during insect development insect endocrinology and aging in insects *Energy Metabolism in Insects* Roger G. H. Downer, 2012-12-06 The scientific program for the XVI International Congress of Entomology held in Kyoto Japan August 3-9 1980 included a symposium on the subject of Energy Metabolism and Its Regulation in Insects The symposium provided an opportunity to integrate knowledge and focus attention on an important and fundamental aspect of insect biochemistry physiology The energy metabolism of insects differs from that of other animals in a variety of ways including the prodigious amounts of energy expended by flying insects the presence in hemolymph of large concentrations of sugar in the form of the nonreducing disaccharide trehalose the transport of fat in the form of diacylglycerol and the periodic mobilization and deposition of cuticular components during development These differences together with hormones neurohormones and neurotransmitters that are specific to or functionally different in insects serve to demonstrate the unique nature of energy metabolism in insects An obvious corollary from the demonstrated uniqueness of insect energy metabolism is that an understanding of the process may lead to the development of new specific agents or strategies for the suppression of insect pests The present volume is an expanded version of the Kyoto symposium **The Physiology of Insecta V5** Morris Rockstein, 2012-12-02 The Physiology of Insecta Second Edition Volume V is part of a multivolume treatise that brings together the known facts the controversial material and the many unresolved and unsettled problems of insect physiology It features chapters written by the outstanding workers in each of a wide range of insect function areas It is designed to meet a manifest need which has arisen from the phenomenal increase in research activity on insects for an authoritative comprehensive reference work in insect physiology The book begins with a discussion of insect nutrition This is followed by separate chapters on the physiology of digestion and absorption the factors affecting insect heart rates the electrical properties of the insect heart and the hemocytes of insects Subsequent chapters cover the physiological role and the adaptive significance of the main biochemical constituents of insect hemolymph salt and water balance in insects defense reactions in insects and microsomal mixed function oxidases Comprehensive Insect Physiology, Biochemistry, and Pharmacology Gerald A. Kerkut, Lawrence Irwin Gilbert, 1985 Volume 2 on Postembryonic Development deals with such topics as life cycles

structural analysis imaginal discs cuticular proteins intercellular communication polytene chromosomes muscle structure and maturation and regeneration The chapters show that generality of cell development is to be found in insects in contrast to the more specialized cells of vertebrates The way that insect cells preserve their relationships to one another in simple geometries within tubes and sheets has allowed experiments that have given the first records of segmentally repeating gradients and compartments the first quantitative accounts of the way that cells are coupled the first descriptions of the remodelling of gap junctions and the modulation of junctional conductivity by hormones This volume provides up to date accounts that will be of value not only to entomologists but also to all researchers in cell and developmental biology

Regulation: Digestion, Nutrition, Excretion G. A. Kerkut, 2013-10-22 In this volume seven of the chapters deal with feeding and diet which is reasonable since insects consume an estimated 15-20% of all the world's planted crops Many insects even have a specialized larval feeding stage that usually occupies a different ecological niche to the adult and so does not compete for the adult's food stock Other chapters describe the means by which insects maintain their water balance nitrogen balance and temperature balance under a range of conditions These involve regulation by hormonal and behavioural systems that are also described here The 14 chapters are all extensively illustrated and referenced and therefore provide excellent summaries of current knowledge They will be of great value to entomologists zoologists and biologists in general An introduction to entomology; or, Elements of the natural history of insects.
