Stellar Collapse:

Stellar Collapse Chris L. Fryer, 2004-04-30 Supernovae hypernovae and gamma ray bursts are among the most energetic explosions in the universe. The light from these outbursts is for a brief time comparable to billions of stars and can outshine the host galaxy within which the explosions reside. Most of the heavy elements in the universe are formed within these energetic explosions. Surprisingly enough the collapse of massive stars is the primary source of not just one but all three of these explosions. As all of these explosions arise from stellar collapse to understand one requires an understanding of the others. Stellar Collapse marks the first book to combine discussions of all three phenomena focusing on the similarities and differences between them. Designed for graduate students and scientists newly entering this field this book provides a review not only of these explosions but the detailed physical models used to explain them from the numerical techniques used to model neutrino transport and gamma ray transport to the detailed nuclear physics behind the evolution of the collapse to the observations that have led to these three classes of explosions.

Gamma-Ray Bursts: 30 Years of Discovery E.E. Fenimore, Mark Galassi, 2004-10-21

In the last thirty years gamma ray bursts have grown from an oddity to a central position in astrophysics. Not only are they the largest explosions since the big bang capable of flooding most of the universe with gamma rays but their brilliance serves as a backlight that can illuminate the cosmos far deeper into the early universe than any other object. Their unpredictability has forced researchers to use extreme measures to observe them completely autonomous satellites and robotic ground based telescopes. Their bizarre physical properties have pushed us to develop new theories of astrophysical explosions. Topics include global properties of GRBs, X ray flashes, ultra high energy gamma rays, neutrinos, gravity waves, prompt emission and early afterglows, relativistic jets and polarization. GRB030329, GRB progenitors, GRB connection to supernovae, dark versus bright GRBs, late afterglows, GRBs and cosmology, general observations, general theory analysis and observation techniques, present satellites, Swift satellite, future satellites and robotic observing systems.

Dynamics of Stellar System International Astronomical Union, 1975-09-30 The idea of holding this Symposium has its origin in a conversation with G. Contopoulos during the winter of 1973. It was then clear that the progress realized in Stellar Dynamics since the Thessaloniki symposium had given a new shape to the field. Other meetings such as the C.N.R.S. colloquium held in Paris in 1967 or the L.A.V. colloquium held in Cambridge England in 1970 had in the meantime given opportunities to review the advances achieved in several branches of this field. We thought that time had come to organize a general confrontation of the new results obtained in the approach of the gravitational N body problem by different methods in the investigation of spherical and flattened systems in the comparisons with observations and in more theoretical speculations on orbits, integrals of motion, dense nuclei or relativistic stellar dynamics. Things were made easy by the support of Commissions 33 and 37 which welcomed the proposition and by J. R. King who accepted to act as Chairman of the Scientific Organizing Committee. The final decision to meet in Besançon was taken during the XVth General Assembly of the
