Iterative Krylov Methods for Large Linear Systems H. A. van der Vorst, 2003-04-17 Computational simulation of scientific phenomena and engineering problems often depends on solving linear systems with a large number of unknowns This book gives insight into the construction of iterative methods for the solution of such systems and helps the reader to select the best solver for a given class of problems The emphasis is on the main ideas and how they have led to efficient solvers such as CG GMRES and BI CGSTAB The author also explains the main concepts behind the construction of preconditioners The reader is encouraged to gain experience by analysing numerous examples that illustrate how best to exploit the methods The book also hints at many open problems and as such it will appeal to established researchers There are many exercises that motivate the material and help students to understand the essential steps in the analysis and construction of algorithms

Tensor-GMRES Method for Large Sparse Systems of Nonlinear Equations Dan Feng, Research Institute for

Advanced Computer Science (U.S.), Thomas H. Pulliam, 1994 Abstract This paper introduces a tensor Krylov method the tensor GMRES method for large sparse systems of nonlinear equations This method is a coupling of tensor model formation and solution techniques for nonlinear equations with Krylov subspace projection techniques for unsymmetric systems of linear equations Traditional tensor methods for nonlinear equations are based on a quadratic model of the nonlinear function a standard linear model augmented by a simple second order term These methods are shown to be significantly more efficient than standard methods both on nonsingular problems and on problems where the Jacobian matrix at the solution is singular A major disadvantage of the traditional tensor methods is that the solution of the tensor model requires the

factorization of the Jacobian matrix which may not be suitable for problems where the Jacobian matrix is large and has a bad sparsity structure for an efficient factorization We overcome this difficulty by forming and solving the tensor model using an extension of a Newton GMRES scheme Like traditional tensor methods we show that the new tensor method has significant computational advantages over the analogous Newton counterpart Consistent with Krylov subspace based methods the new tensor method does not depend on the factorization of the Jacobian matrix As a matter of fact the Jacobian matrix is never needed explicitly
