*A Framework to Facilitate the Use of Systematic Reviews and*

*Meta-analyses in the Design of Primary Research Studies*, 2012 OBJECTIVES Systematic reviews are currently used by only a minority of researchers to inform the design of research studies This may lead to inefficient and potentially wasteful research We aimed to develop a framework which clinical researchers can apply to existing systematic reviews in order to effectively inform the design of proposed new clinical research studies DATA SOURCES Published frameworks or models designed to use results of systematic reviews or meta analyses in new research study design REVIEW METHODS A multiphase iterative process was used to develop the framework Phase 1 involved a focused literature search to identify existing frameworks and processes that have been proposed as methods to identify research gaps by systematic reviews In phase 2 we convened a multidisciplinary group with varied expertise to develop a stepwise framework In phase 3 we identified two systematic reviews and applied this framework to their results Phase 4 invited external opinions from additional experts to further refine the framework RESULTS We developed a four step framework designed to be useable by primary researchers Step 1 involves clearly laying out the crucial design elements of the proposed study using PICOTS populations interventions comparators outcomes timing and setting elements Step 2 provides a simple method to identify an existing systematic review which is current valid and relevant enough to the proposed research study to inform its design In Step 3 the details of the systematic review are examined to determine the extent to which it has already addressed the questions proposed by the new study and uses the PICOTS elements of the primary studies included in the systematic review to modify the design of the proposed study Finally Step 4 establishes the need or otherwise for the proposed study and prioritizes modifications to the research design CONCLUSIONS The four step framework proposes a practical method which can be used by clinical researchers who are not experts in systematic reviews to determine whether further research studies are needed and suggest ways that the primary literature identified by the systematic review can be used to modify the design of further research studies Further

research needs to determine how useful and practical this proposed framework is for researchers and attempt to measure its value in modifying research designs and optimizing research efficiency *Modern Approaches to Augmentation of Brain Function* Ioan Opris, Mikhail A. Lebedev, Manuel F. Casanova, 2021-08-25 This book covers recent advances in neural technology that provide for enhancements for brain function. It addresses a broad range of neural phenomena occurring in the brain circuits involved in perception, cognition, emotion, and action that represent the building blocks of behavior and cognition. Augmentation of brain function can be achieved by using brain implants for recordings, stimulation, or drug delivery. Alternative methods include employing brain-machine interfaces as well as noninvasive activation of certain brain areas. This volume evaluates existing methods of brain augmentation while discussing the brain circuitry and neuronal mechanisms that make augmentation possible. This volume offers novel insights into brain disorders and explores new devices for brain repair while also addressing the philosophical and ethical implications of brain augmentation. The information in this book is relevant to researchers in the fields of neuroscience, engineering, and clinical practice. Advance Praise for *Modern Approaches to Augmentation of Brain Function* This impressive book by leading experts in neuroscience and neuroengineering lays out the future of brain augmentation in which the human mind and machine merge, leading to a rapid exponential growth of the power of humanity. Ray Kurzweil, best-selling author, inventor, entrepreneur, and a recipient of the National Medal of Technology and Innovation 1999 and the Lemelson MIT Prize 2001. This book employs a holistic approach in covering the recent advances in the fields of neuroscience, neuroinformatics, neurotechnology, and neuro-psycho pharmacology. Each chapter of the book covers major aspects of modern brain research in connection with the human mind and behavior and is authored by researchers with unique expertise in their field. Ioan Dumitache, Prof Dr Eng, Faculty of Computer Science, Polytechnic University of Bucharest, Bucharest, Romania. This book presents compelling perspectives on what interactive neuroscience will look like in the future, delving into the innovative ideas of a diverse set of neuroscientists and speculating on the different ways computer chips implanted in the brains of humans can effect intelligence and communication. György Buzsáki, MD, PhD, is the Biggs Professor of Neuroscience, NYU School of Medicine, New York, NY. Systematic Reviews Cynthia Diane Mulrow, Deborah Cook, 1998 The use and creation of systematic reviews with a discussion on their value and information on how to locate, appraise, and use them and on state-of-the-art methods for conducting them. How to Perform a Systematic Literature Review Edward Purssell, Niall McCrae, 2024-12-11 This new edition is an authoritative and accessible textbook to an activity that is often found overwhelming. The systematic review is a rigorous method of collating and synthesizing evidence from multiple studies producing a whole greater than the sum of parts. The authors steer readers on a logical path through the process taking account of the different needs of researchers, students, and practitioners in health and social care. Practical guidance is provided on the fundamentals of systematic reviewing and also on advanced techniques such as meta-analysis. Examples are given throughout with a succinct glossary to support the text. This new edition updates the

first edition by considering a range of new and emerging issues in the systematic review process. In particular, the need for evidence to be systematically appraised in a timely manner, particularly during public health emergencies and when urgent patient care issues are being considered. The balance between speed and comprehensiveness. New and developing areas of interest such as living reviews and rapid reviews, both of which increased during Covid 19. Advances in methodologies and in particular meta-analysis methods. The introduction of AI and other automated processes of data management. This up to date accessible textbook will satisfy the needs of students, practitioners and educators in the sphere of health and social care. The authors will advise some freely available or inexpensive open source access resources such as PubMed, R and Zotero to help students how to perform a systemic review and to see how this informs the guideline and decision making process.

**Finding What Works in Health Care** Institute of Medicine, Board on Health Care Services, Committee on Standards for Systematic Reviews of Comparative Effectiveness Research, 2011-07-20. Healthcare decision makers in search of reliable information that compares health interventions increasingly turn to systematic reviews for the best summary of the evidence. Systematic reviews identify, select, assess and synthesize the findings of similar but separate studies and can help clarify what is known and not known about the potential benefits and harms of drugs, devices and other healthcare services. Systematic reviews can be helpful for clinicians who want to integrate research findings into their daily practices for patients to make well informed choices about their own care for professional medical societies and other organizations that develop clinical practice guidelines. Too often systematic reviews are of uncertain or poor quality. There are no universally accepted standards for developing systematic reviews, leading to variability in how conflicts of interest and biases are handled, how evidence is appraised and the overall scientific rigor of the process. In *Finding What Works in Health Care*, the Institute of Medicine (IOM) recommends 21 standards for developing high quality systematic reviews of comparative effectiveness research. The standards address the entire systematic review process from the initial steps of formulating the topic and building the review team to producing a detailed final report that synthesizes what the evidence shows and where knowledge gaps remain. *Finding What Works in Health Care* also proposes a framework for improving the quality of the science underpinning systematic reviews. This book will serve as a vital resource for both sponsors and producers of systematic reviews of comparative effectiveness research.
