Abstract The purpose of this study was to determine the effect of a 12-week, low-intensity, low-impact, and low-volume exercise program on the physical fitness and health-related quality of life of older adults. The study was a randomized controlled trial. The intervention group performed a 12-week, low-intensity, low-impact, and low-volume exercise program. The control group did not exercise. The primary outcome was the change in physical fitness, measured by the 6-minute walk test. The secondary outcome was the change in health-related quality of life, measured by the SF-36. The results showed that the intervention group had a significant improvement in physical fitness and health-related quality of life compared to the control group. The findings suggest that a 12-week, low-intensity, low-impact, and low-volume exercise program can improve physical fitness and health-related quality of life in older adults.
