

Ozone is created primarily by sunlight. When high-energy ultraviolet rays (UV-C) strike an oxygen molecule (O_2), they split the molecule into two single oxygen atoms, known as atomic oxygen.

A freed oxygen atom then combines with another oxygen molecule to form a molecule of ozone (O_3). Because there is so much oxygen in our atmosphere, this "ozone-oxygen cycle" is continuously absorbing high-energy ultraviolet radiation (UV-C) and completely blocking it from reaching the Earth's surface. This process creates heat which warms the upper part of the stratosphere.
