Natural Selection of the Chemical Elements Robert Joseph Paton Williams,J. J. R. Fraústo da Silva,1996 This beautifully written book is a study of the physical relationship between the inanimate environment and living organisms It describes how the evolution of both has been interactive and interdependent the authors show that this can be explained in terms of the properties of the chemical elements and their compounds The book discusses the physical and chemical balances between the animate and inanimate worlds with kinetic and thermodynamic principles given to support this analysis These principles are applied to both organic and inorganic chemical systems to provide a basis for understanding the evolution of life in terms of the interaction of both types of chemistry within ever more complex organizations The book concludes with an examination of an intriguing problem the long term consequences of our manufacture and exploitation of chemicals This intervention may be altering the symbiotic relationship between life and the environment an issue of great concern to ecologists and biologists
