## **The Development Of Thought Equilibration Of Cognitive Structures:**

The Development of Thought Jean Piaget, 1977 Jean Piaget is unquestionably one of the world's most renowned psychologists. This book encompasses his latest research and recasts his previous conclusions in the light of his recent work. His central idea is that knowledge proceeds neither from intuitive or logical internal processes but that it develops from a series of cognitive structures built one above the other requiring continuous adjustment and leading to further constructions.

**Publisher description**      The Equilibration of Cognitive Structures Jean Piaget, 1985      The Development of Thought: equilibration of Cognitive Structures. Translated by Arnold Rosin Jean Piaget, 1978      The Development of Mathematical Thinking Herbert Ginsburg, 1983      The Routledge International Handbook of Dialectical Thinking Nick Shannon, Michael F. Mascolo, Anastasia Belolutskaia, 2024-07-23

The Routledge International Handbook of Dialectical Thinking is a landmark volume offering a multi-disciplinary compendium of the research theory and practice that defines dialectical thinking its importance and how it develops over the lifespan. For the first time this handbook brings together theory and research on dialectical thinking as a psychological phenomenon from early childhood through the human lifespan. Grounding dialectical thinking in multiple philosophical traditions stemming from antiquity it explores current psychological models of such thought patterns and shows how these can be applied in everyday life and across multiple disciplines including philosophy physics mathematics and international relations. The handbook explains the nature of dialectical thinking why it is important and how it can be developed in children and in adults. It concludes with a final chapter depicting a discussion among the authors exploring the question how could dialectical thinking be the antidote to dogma. Written by a group of international scholars this comprehensive publication is an essential reference for researchers and graduate students in psychology and the social sciences as well as scholars interested in integrating different perspectives and issues from a wide variety of disciplines.

**Thought and Emotion** D. J. Bearison, H. Zimiles, 2014-01-14

First published in 1985 The purpose of this book reflects the 1983 Piaget Society decision to contribute some ideas to a

critical problem in psychology how the structure and function of intelligence and affectivity are developmentally related Although this is a fundamental question in psychology it has largely been ignored at different periods in its history With the maturing of the cognitive sciences in the past quarter of a century there today is a recrudescence of interest in the ways in which affect influences cognition

**Self-Organization in the Nervous System** Yan M. Yufik, Biswa Sengupta, Karl Friston, 2017-11-30 This special issue reviews state of the art approaches to the biophysical roots of cognition These approaches appeal to the notion that cognitive capacities serve to optimize responses to changing external conditions Crucially this optimisation rests on the ability to predict changes in the environment thus allowing organisms to respond pre emptively to changes before their onset The biophysical mechanisms that underwrite these cognitive capacities remain largely unknown although a number of hypotheses has been advanced in systems neuroscience biophysics and other disciplines These hypotheses converge on the intersection of thermodynamic and information theoretic formulations of self organization in the brain The latter perspective emerged when Shannon s theory of message transmission in communication systems was used to characterise message passing between neurons In its subsequent incarnations the information theory approach has been integrated into computational neuroscience and the Bayesian brain framework The thermodynamic formulation rests on a view of the brain as an aggregation of stochastic microprocessors neurons with subsequent appeal to the constructs of statistical mechanics and thermodynamics In particular the use of ensemble dynamics to elucidate the relationship between micro scale parameters and those of the macro scale aggregation the brain In general the thermodynamic approach treats the brain as a dissipative system and seeks to represent the development and functioning of cognitive mechanisms as collective capacities that emerge in the course of self organization Its explicanda include energy efficiency enabling progressively more complex cognitive

operations such as long term prediction and anticipatory planning A cardinal example of the Bayesian brain approach is the free energy principle that explains self organizing dynamics in the brain in terms of its predictive capabilities and selective sampling of sensory inputs that optimise variational free energy as a proxy for Bayesian model evidence An example of thermodynamically grounded proposals in this issue associates self organization with phase transitions in neuronal state spaces resulting in the formation of bounded neuronal assemblies neuronal packets This special issue seeks a discourse between thermodynamic and informational formulations of the self organising and self evidencing brain For example could minimization of thermodynamic free energy during the formation of neuronal packets underlie minimization of variational free energy
