

Superconductivity

The phenomenon by which the resistivity of some metals suddenly falls to zero below certain temperature is called transition temperature or critical temperature (T_c) is called superconductivity.

The phenomenon of superconductivity was discovered by Kannerlingh Onnes in 1911. Eg: For mercury ($T_c = 4.2\text{K}$) ; for aluminium($T_c = 1.175\text{K}$)

Properties of superconductors

(i) Effect of temperature: Transition temperature (T_c)

Transition temperature (T_c) is that temperature, below which the resistivity of superconductor falls to zero and above which it acts as a normal conductor.

(ii) Effect of magnetic field: Critical field (H_c)

The minimum strength of magnetic field required to destroy the superconducting nature of a metal at transition temperature is called critical field H_c .

The metal acts as a superconductor, when temperature is less than transition temperature and field is less than critical field. When $H < H_c$ and $T < T_c$, metals acts as a superconductor

- Variation of critical field H_c and temperature is shown below.

$$H_c = H_0 \left[1 - \frac{T^2}{T_c^2} \right] \quad \text{where } H_c - \text{critical field at } T\text{K};$$

H_0 - critical field at 0K; T_c - transition temperature

(iii) Effect of current density: critical current- Silsbee effect

- The minimum current that can be passed through a superconducting material without destroying the superconducting property is called critical current I_c . $I_c = 2\pi r H_c$

where H_c is critical magnetic field and r is radius of superconducting rod (wire)

- The minimum current that can be passed through a superconductor per unit area of cross section,

without destroying the superconducting property is called critical current density J_c . $J_c = \frac{I_c}{A} = \frac{2\pi r H_c}{\pi r^2} = \frac{2H_c}{r}$

(iv) Isotope effect:

- Discovered by Maxwell and Reynold in 1950.
- Variation of transition temperature with isotopic mass is called isotope effect.
- Transition temperature and isotopic mass are inversely proportional. $T_c \propto \frac{1}{M^{\frac{1}{2}}}$

where M is isotopic mass and $\alpha = \frac{1}{2}$ (a constant)

$$T_c \times M^{\frac{1}{2}} = \text{a constant}$$

$$T_c \sqrt{M} = \text{a constant}$$

Gregory, 2012-12-06 Since the discovery of superconductivity in 1911 by H Kamerlingh Onnes of the order of half a billion dollars has been spent on research directed toward understanding and utilizing this phenomenon This investment has gained us fundamental understanding in the form of a microscopic theory of superconductivity Moreover superconductivity has been transformed from a laboratory curiosity to the basis of some of the most sensitive and accurate measuring devices known a whole host of other electronic devices are soon to be new international standard for the volt a prototype generation of superconducting motors and generators and magnets producing the highest continuous magnetic fields yet produced by man The promise of more efficient means of power transmission and mass transportation a new generation of superconducting motors and generators and computers and other electronic devices with superconducting circuit elements is all too clear The realization of controlled thermonuclear fusion is perhaps totally dependent upon the creation of enormous magnetic fields over large volumes by some future generation of superconducting magnets Nevertheless whether or not the technological promise of superconductivity comes to full flower depends as much and perhaps more upon economic and political factors as it does upon new technological and scientific breakthroughs The basic science of superconductivity and its technological implications were the subject of a short course on The Science and Technology of Superconductivity held at Georgetown University Washington D C during 13-26 August 1971 **Superconductivity; Proceedings.
