ways that design can take advantage of production methods so that architecture is neither independent of nor dominated by technology

Surface Architecture of Fungal Pathogens Marcio Rodrigues, 2012-05-01 Surface components in fungal cells include cell wall molecules and in certain cases capsular structures. In pathogens these components are responsible for key events during interaction with the host. These events include recognition of pathogens by the immune system and generation of damage to host cells and tissues. The molecular nature of surface structures in fungi is vast and may include glyco proteins polysaccharides lipids and pigments. Many of them have been strictly associated with the antifungal immune response as well as with steps of fungal adhesion and dissemination during interaction with host cells. For many fungal pathogens surface composition and architecture are determinant for either disease progression or control. The diversity of the composition of the cell surface and its molecular architecture are believed to include targets for the action of new antifungals as well as immunogens with potential to interfere with fungal diseases in favor of the host

Tensile Surface Structures Michael Seidel, 2009-08-11 Tensile surface structures are the visual expression of an intensive rethinking of the topic of building envelopes by designers. Advances in design methods materials construction elements and assembly and erection planning in the field of lightweight construction are enabling ever more exacting applications of tensile structures with envelope and structural functions especially in roofing over large clear spans without internal support. However the particular mechanical characteristics of the materials used in the construction of textile structures demand consideration of the question of buildability. This book provides answers by discussing the fundamental influence of material manufacture and assembly in deciding the most suitable type of building or structure and its detailing in the design process. The fundamentals of material composition manufacturing process patterning and the behaviour of flexible structural systems are all explained here as well as their use as structural and connection elements and special attention is given to the erection of wide span lightweight structures. The erection equipment is described as well as the lifting and tensioning process and the construction methods used to erect the characteristic types of tensile structures illustrated with a selection of example projects
