Rabiner,1973 **An Introduction to Text-to-Speech Synthesis** Thierry Dutoit,1997-04-30 This is the first book to treat two areas of speech synthesis natural language processing and the inherent problems it presents for speech synthesis and digital signal processing with an emphasis on the concatenative approach The text guides the reader through the material in a step by step easy to follow way The book will be of interest to researchers and students in phonetics and speech communication in both academia and industry Improvements in Speech Synthesis E. Keller,G. Bailly,A. Monaghan,J. Terken,M. Huckvale,2001-11-28 Naturalness in synthetic speech is one of the most intractable problems in information technology today Although speech synthesis systems have improved considerably over the last 20 years they rarely sound entirely like human speakers Why is this so and what can be done about it Prosodic processing must be rendered more varied and more appropriate to the speech situation Timing melodic control and the relationships between the various prosodic

parameters need increased attention Signal processing systems must be developed and perfected that are capable of generating more than just one voice from a database A better understanding must be achieved of what distinguishes one voice from another and of how speech styles differ between simply reading aloud numbers and sentences and their use in interactive speech New evaluation methodologies should be developed to provide objective and subjective measurements of the intelligibility of the synthetic speech and the cognitive load imposed upon the listener by impoverished stimuli Adequate text markup systems must be proposed and tested with multiple languages in real world situations Further research is required to integrate speech synthesis systems into larger natural language processing systems Improvements in Speech Synthesis presents the latest research in the above areas Contributors include speech synthesis specialists from 16 countries with experience in the development of systems for 12 European languages This volume emerges from a four year European COST project focussed on The Naturalness of Synthetic Speech and will be a valuable text for everyone involved in speech synthesis

**Introduction to Electronic Speech Synthesis** Neil Sclater,1983 *Electronic Synthesis of Speech* R. Linggard,1985-01-10 *Electronic Speech Synthesis* Geoff Bristow,1984 *Speech and Language Processing* Dan Jurafsky,James H. Martin,2009 This book takes an empirical approach to language processing based on applying statistical and other machine learning algorithms to large corpora Methodology boxes are included in each chapter Each chapter is built around one or more worked examples to demonstrate the main idea of the chapter Covers the fundamental algorithms of various fields whether originally proposed for spoken or written language to demonstrate how the same algorithm can be used for speech recognition and word sense disambiguation Emphasis on web and other practical applications Emphasis on scientific evaluation Useful as a reference for professionals in any of the areas of speech and language processing

Expression in Speech Mark Tatham,Katherine Morton,2003-10-16 This book is about the nature of expression in speech It is a comprehensive exploration of how such expression is produced and understood and of how the emotional content of spoken words may be analysed modelled tested and synthesized Listeners can interpret tone of voice assess emotional pitch and effortlessly detect the finest modulations of speaker attitude yet these processes present almost intractable difficulties to the researchers seeking to identify and understand them In seeking to explain the production and perception of emotive content Mark Tatham and Katherine Morton review the potential of biological and cognitive models They examine how the features that make up the speech production and perception systems have been studied by biologists psychologists and linguists and assess how far biological behavioural and linguistic models generate hypotheses that provide insights into the nature of expressive speech The authors use recent techniques in speech synthesis and automatic speech recognition as a test bed for models of expression in speech Acknowledging that such testing presupposes a comprehensive computational model of speech production they put forward original proposals for its foundations and show how the relevant data structures may be modelled within its framework This pioneering book will be of central interest to researchers in linguistics and in

speech science pathology and technology It will also be valuable for behavioural and cognitive scientists wanting to know more about this vital and elusive aspect of human behaviour     **Making Computers Talk** Ian H. Witten,1986
