# Investigating the influence of visuospatial stimuli on driver's speed perception: a laboratory study

Anna-Lena Köhler<sup>1\*</sup> , Maren Klatt<sup>1</sup>, Irling Koch<sup>2</sup> and Stefan Ladwig<sup>1</sup>

## Abstract

Driving at an inappropriate speed is a major accident cause in the EU. Understanding the underlying sensory mechanisms can help to reduce speed and increase traffic safety. The present study investigated the effect of visuospatial stimuli on speed perception using an adaptive countermeasure to speeding based on a manipulation of optic flow. We added red lights on both sides of a simulated road. We expected speed to be perceived as faster when lights moved toward drivers due to increased optic flow, whereas we expected static light stimuli to not alter the optic flow and thus not influence speed perception. Two experiments applied the method of constant stimuli. To this end, participants encountered several trials of two video sequences on a straight road. A reference sequence showed the same travelling speed while test sequences varied around different traveling speeds. Participants indicated which sequence they perceived as faster, leading to the calculation of the point of subjective equality (PSE). A lower PSE indicates that the speed in this experimental condition is perceived as faster than in another experimental condition. Experiment 1A did not show a difference between PSEs of static and oncoming lights. Because participants had counted reflector posts for speed estimation, we removed these reflector posts in Experiment 1B and found a lower PSE for oncoming lights. Thus, such light stimuli may have an effect only in situations without other competing visual stimuli supporting speed perception. Future research should investigate whether speed perception is indeed a primarily visuospatial control task or whether other sensory information such as auditory factors can have an influence as well.

## Significance statement

Inappropriate speed remains a major cause of accidents. There is a variety of interventions aiming at lowering driving speed inappropriate for a given context. Countermeasures to speeding in the driving infrastructure can target every driver in potential areas. Understanding the mechanisms in speed perception can help to develop

better interventions. The present two experiments investigated the role of visual stimuli in speed perception based on a dynamic light-based intervention that led to lower driving speeds in a previous simulator study and field test (Köhler et al., 2022). Our findings show that oncoming lights lead to lower perceived traveling speed, but only when there are no other salient visual stimuli that support speed perception. In sum, the findings provide valuable insights for future development of countermeasures targeting speeding.

Time Perception and Dysfunction: Clinical and Practical Implications Deana Dávalos,Giovanna Mioni,Simon Grondin,Felipe Ortúñoz,2019-02-19

Processing time requires a complex set of abilities that dictates how one adapts to the environment Timing is key in how we communicate organize our space and understand the world When timing is intact it often exists below one's conscious awareness but when one's ability to process time is disrupted the effects are noticeable and widespread To better understand the construct of temporal dysfunction one has to examine the concept of timing from multiple angles An integrative approach is required to understand the possible biological cognitive and psychological etiologies of temporal dysfunction In addition expertise in language measurement and psychopathology are necessary to comprehend how timing affects one's representation of the world This Research Topic is dedicated to examining timing and temporal dysfunction across a variety of tasks and disorders Specifically we seek to understand the most basic types of timing dysfunction and how they may affect a wide range of behaviors and symptoms as well as higher levels of temporal deficits involved in how one perceives the time spent This Research Topic represents the intersection of medicine psychology cognition and perception in a unified attempt to shed light on temporal processing The collection of original research articles and case studies highlighting novel methodologies and interventions illustrates the complexity of timing dysfunction and how understanding these deficits helps us to get a fresh look at a wide range of clinical psychopathologies and to develop better interventions *Perception*, 2007

Metaphysicians have for centuries attempted to clarify the nature of the world and how rational human beings construct their ideas of it Materialists believed that the world including its human component consisted of objective matter an irreducible substance to which qualities and characteristics could be attributed Mind thoughts ideas and perceptions was viewed as a more sophisticated material substance Idealists on the other hand argued that the world acquired its reality from mind which breathed metaphysical life into substances that had no independent existence of their own These two camps

seemed deadlocked until Immanuel Kant's Critique of Pure Reason endeavored to show that the most accurate theory of reality would be one that combined relevant aspects of each position yet transcended both to arrive at a more fundamental metaphysical theory. Kant's synthesis sought to disclose how human reason goes about constructing its experience of the world thus intertwining objective stimuli with rational processes that arrive at an orderly view of nature. *Comprehensive Speed Perception* Louis Oppenheimer, 1976    **Steven's Handbook of Experimental Psychology: Perception and motivation** Stanley Smith Stevens, Richard C.
