## **Stereographic Projection:**

**An Introduction to Mineral Sciences** A. Putnis, 1992-10-22 The subject of mineralogy is moving away from the traditional systematic treatment of mineral groups toward the study of the behaviour of minerals in relation to geological processes A knowledge of how minerals respond to a changing geological environment is fundamental to our understanding of many dynamic earth processes By adopting a materials science approach *An Introduction to Mineral Sciences* explains the principles underlying the modern study of minerals discussing the behaviour of crystalline materials with changes in temperature pressure and chemical environment The concepts required to understand mineral behaviour are often complex but are presented here in simple non mathematical terms for undergraduate mineralogy students After introductory chapters describing the principles of diffraction imaging and the spectroscopic methods used to study minerals the structure and behaviour of the main groups of rock forming minerals are covered and the role of defects in the deformation and transformation of a mineral are explained The energy changes and the rate of transformation processes are introduced using a descriptive approach rather than attempting a complete and rigorous treatment of the thermodynamics and kinetics Examples and case histories from a range of mineral groups are set in an earth science context such that the emphasis of this book is to allow the student to develop an intuitive understanding of the structural principles controlling the behaviour of minerals

*Portraits of the Earth* Timothy G. Feeman, Every map is a tool a product of human effort and creativity that represents some aspects of our world or universe This course was powered by the belief that by exploring the mathematical ideas involved in creating and analyzing maps students would see how mathematics could help them to understand and explain their world from the Preface *Portraits of the Earth* exemplifies the AMS's mission to bring the power and vitality of mathematical thought to the nonexpert It is designed to teach students to think logically and to analyze the technical information that they so readily encounter every day Maps are exciting visual tools that we encounter on a daily basis from street maps to maps of the world accompanying news stories

to geologic maps depicting the underground structure of the earth This book explores the mathematical ideas involved in creating and analyzing maps a topic that is rarely discussed in undergraduate courses It is the first modern book to present the famous problem of mapping the earth in a style that is highly readable and mathematically accessible to most students Feeman's writing is inviting to the novice yet also interesting to readers with more mathematical experience Through the visual context of maps and mapmaking students will see how contemporary mathematics can help them to understand and explain the world Topics explored are the shape and size of the earth basic spherical geometry and why one can't make a perfect flat map of the planet The author discusses different attributes that maps can have and determines mathematically how to design maps that have the desired features The distortions that arise in making world maps are quantitatively analyzed There is an in depth discussion on the design of numerous map projections both historical and contemporary as well as conformal and equal area maps Feeman looks at how basic map designs can be modified to produce maps with any center and he indicates how to generalize methods to produce maps of arbitrary surfaces of revolution Also included are end of chapter exercises and laboratory projects Particularly interesting is a chapter that explains how to use MapleR add on software to make maps from geographic data points This book would make an excellent text for a basic undergraduate mathematics or geography course and would be especially appealing to the teacher who is interested in exciting visual applications in the classroom It would also serve nicely as supplementary reading for a course in calculus linear algebra or differential geometry Prerequisites include a solid grasp of trigonometry and basic calculus
