The Cat:

2 A.M. at The Cat's Pajamas Marie-Helene Bertino, 2014-08-14 Madeleine Altimari is a sassy smart mouthed nine year old and an aspiring jazz singer inwardly mourning the recent death of her mother Little does she know that on Christmas Eve she is about to have the most extraordinary day and night of her life After bravely facing down some mean spirited classmates and a galling rejection at school Madeleine doggedly searches for Philadelphia's legendary jazz club The Cat's Pajamas where she's determined to make her on stage debut Meanwhile her fifth grade teacher Sarina Greene is nervously looking forward to a dinner party that will reunite her with an old high school crush And across town at The Cat's Pajamas club owner Jack Lorca discovers that his beloved haunt may have to close forever As these three lost souls search for love music and hope on the snow covered streets of Philadelphia together they will discover life's endless possibilities over the course of one magical night A vivacious charming and moving debut 2am At The Cat's Pajamas will swell your heart and have you laughing out loud

Postnatal Development of the Cat's Retina M. Vogel, 2012-12-06 References 59 Subject Index 65 6 Introduction The retina as an organ of perception of light colour shape and movement has been the subject of numerous and intensive light and electron microscopical investigations To date the interest in these has largely been concentrated on the structure of the mature retina and the genesis of its cellular elements The first exhaustive observations on the development of the retina in vertebrates were made by Babuchin 1863 Using the retinae of chicken embryos he showed that Millier's radial fibres and the ganglion cells are the first to develop while the receptor segments are the last Subsequently the early differentiation of Millier's radial fibres was often reaffirmed Cajal 1893 Meller 1968 Bhattacharjee and Sanyal 1975 and others Furthermore Babuchin had already indicated that the structural development in the area of the posterior pole is very rapid compared with those regions of the retina which are situated more peripherally Today when comparing results of electron microscopical investigations this fact is of particular importance since in each case only very limited areas of the retina can be examined Schultze 1867a b pointed out the uniformity of origin and the general classification of light perceiving elements into inner and outer segments thus contesting the hitherto generally held opinion that these structures like the pigment epithelium originate of the eye cup In 1881 Ogneff discovered the analogous ginate from the outer leaf mode of formation in birds and mammals
