I. Berger,1995-12-31 The science of semiconducting materials is still very young Less than twenty years ago the school of A F Ioffe demonstrated that the properties of semiconductors are governed primarily by their chemical nature and can be predicted on this basis These ideas are still being developed and used to establish a new materials science the chemistry of semiconductors The solution of problems in the chemistry of semiconductors should make it possible to find new applications for solids We are already witnessing the process in which the practical importance of such new materials as diamond like Al<sub>1.0</sub>Si<sub>0.4</sub>Ge<sub>0.6</sub> compounds is accelerating the development of the chemistry and physics of semiconductors and some allied sciences Diamond like semiconductors are promising materials for modern electronics They belong to an extensive class of valence compounds which seem to be an inexhaustible source of new semiconducting materials Among these new particularly promising materials are ternary diamond like semiconductors which are the subject of the present monograph The appearance of this book which is the first on this subject not only in the Soviet Union but also outside it is the proof of the importance attached to promising semiconductors in the USSR The authors describe the methods for the preparation of compounds and the growth of single crystals They analyze in detail the physicochemical and physical properties of ternary compounds and the relationships between these properties and consider the possible applications of these substances and suggest further investigations **Astronautics Information** ,1964
