Ten Years Of Concurrency Semantics:

Ten Years of Concurrency Semantics Jacobus Willem Bakker, J. J. M. M. Rutten, Amsterdam Concurrency Group, 1992 This collection of reprints describes a unified treatment of semantics covering a wide range of notions in parallel languages Included are several foundational and introductory papers developing the methodology of metric semantics studies on the comparative semantics of parallel object oriented and logic programming and papers on full abstraction and transition system specifications In addition links with process algebra and the theory of domain equations are established Throughout a uniform proof technique is used to relate operational and denotational models The approach is flexible in that both linear time branching time or bisimulation and intermediate models can be handled as well as schematic and interpreted elementary actions The reprints are preceded by an extensive introduction surveying related work on metric semantics

Approach to Process Calculi Joshua Robert Xavier Ross, 1999 Abstract Process Calculi have starting with Milner's CCS traditionally been expressed by specifying the operational semantics in terms of action labelled transition relations between process expressions Normally this has been done using transitions that are inductively defined by rules following the structure of the process expressions This approach has been very successful but has suffered from certain problems One of these is that the construction of weak branching time congruences has not been as simple as one might wish In particular the natural weak bisimulations are not congruences typically shown up by the introduction of summation Secondly this method has not lent itself to the development of congruences for calculi that combine features of concurrency and higher order functional languages Another problem is more aesthetic It is that in order to write these transition relations we need to use silent tau actions which are supposed to be unobservable However we need to represent them explicitly and make explicit reference to them in defining the congruence relations In this thesis an approach to process calculi based on evaluation to committed forms is presented In particular two process calculi are given The first is a first order CCS like calculus NCCS This demonstrates the possibility of giving natural weak branching time congruences with such features as summation without the use of explicit silent actions Various bisimulations are defined on NCCS and these are related to existing equivalences for CCS The second is a higher order calculus based on CML a higher order functional language extended with concurrent features Again it is shown that a natural weak branching time congruence exists In both cases a transition relation is also given and the relationship between evaluation and transition is shown **Revue Roumaine de**
