important factor in an individual's evolutionary fitness. Therefore foraging is organised as efficiently as possible. The prey species that were selected and hunted by Neanderthals are analysed. The author investigates economic considerations that influenced Neanderthal prey choice. These considerations are based on estimates of the population densities of the available prey species and on estimates of the relative difficulty of hunting those species. The results demonstrate that when Neanderthals operated within poor environments their prey choice was constrained; they were not able to hunt species living in large herds. In these environments solitary species were the preferred prey. It is striking that Neanderthals successfully focussed on the largest and most dangerous species in poor environments. However, in richer environments these constraints were lifted and species living in herds were successfully exploited. In order to assess the accuracy of this approach, bone assemblages formed by cave hyenas are also analysed. The combined results of the Neanderthal and hyena analyses show that an optimal foraging perspective provides a powerful tool to increase our understanding of Pleistocene ecology. The niches of two social carnivores of similar size which were seemingly similar are successfully distinguished. This result lends extra credence to the conclusions regarding Neanderthal foraging strategies. This book contributes to the debate surrounding Neanderthal competence and ability. It combines an up-to-date review of current knowledge on Neanderthal biology and archaeology with novel approaches to the archaeological record. It is thus an important contribution to the current knowledge of this enigmatic species.

*Behavioral and Morphological Development in a Female-dominated Species, the Spotted Hyena, Crocuta Crocuta* Jaime Beth Tanner, 2007      **Long-distance Vocal Communication in the Spotted Hyena, Crocuta Crocuta** Keron M. Greene, 2002      *The Hunters Or the Hunted?* C. K. Brain, 1983-08. Amongst scientists involved in taphonomy C. K. Brain stands out as the pioneer; this impressive book is a statement of his investigations. *The Hunters or the Hunted* is a very important book for paleoanthropology. It presents the first thorough analysis of the Sterkfontein Valley assemblages, contributing significantly to the resolution of lingering controversies and by placing the old information in a fresh perspective enables new and more sophisticated questions to be asked not only of the South African material but of similar assemblages elsewhere. Another contribution is that it reinforces the recent change in feelings as to what constitutes data for the value of looking at fossil and contemporary bones as closely as this is clear. Brain urges the necessity of recovering fossils with a high regard for subtle detail. I hope excavators of any vertebrate fossil site will be persuaded to follow his advice and pay more attention to these features of bone accumulations that have been previously neglected for taphonomy can be a powerful tool in elucidating the problems of fossil assemblages especially when handled with the care and caution that Brain brings to the subject.
