Spot Test Analysis:

Spot Tests in Organic Analysis F. Feigl, V. Anger, 2012-12-02 Covering all theoretical and practical aspects of the applications of spot tests to organic analysis this book includes information on more than 900 tests It continues to be an indispensable reference to organic and analytical chemists in academia and in industry

Spot Tests in Inorganic Analysis F. Feigl, V. Anger, 2012-12-02 Many years have passed since the last edition of the present book was published The discovery during this period of many new reagents has resulted in a vast accumulation of data on their application and made this completely revised edition necessary Numerous new tests and various new chapters have been added Chapters 3 4 and 5 of the fifth edition have been combined into one chapter which is divided into sections devoted to the elements These sections are arranged in alphabetical order to make for easier location of information on a given element To further improve the usefulness of the volume a reference list has been provided for each sub section followed by a biography of the appropriate quantitative methods

Analytical Profile of the Resin Spot Test Method Vladimir Grdinic, 2018-05-04 The working title of the book was The Detection of Analytes by the Resin Spot Tests Method Firstly we decided to sort out all published qualitative methods systematically against analytes We were not discouraged by the obstacles such as the study of a great number of papers published in Japanese the difficulty in locating especially older publications or the time required Still having in mind not to burden unnecessarily the volume of the book we dismissed the idea of systematically listing all the procedures in detail Nevertheless a relatively large number of them found a place in the book and perhaps this will contribute to the stirring of spontaneous interest in this technique in the ranks of applied chemists and others who a priori shun the technique

Development, Present State, and Outlook of Spot Test Analysis Fritz Feigl, 1950 When I received the invitation to speak at the Fifty second Annual Meeting of the A S T M on some phase of spot test analysis 28 years had passed since I had shown in my doctorate thesis that surprisingly sensitive tests for metals can be made by

means of spot reactions carried out on filter paper In the meantime isolated applications of spot reactions have grown into spot test analysis which is a method of detecting or sometimes of quantitatively determining inorganic and organic materials This development was made possible only because of the active collaboration of workers in many countries The common efforts have been aimed not merely toward improving a technique which is fundamentally so simple as carrying out known tests within the volume of a single drop Far more important has been the discovery of new tests and especially the demonstration of the possibilities of making practical applications of spot reactions The utility of spot reactions in testing materials was soon recognized Indeed it may be said that spot testing became so popular precisely because it proved to be so valuable in solving problems in the field of testing materials This statement is supported by the fact that a series of papers on spot test methods are to be presented at this symposium With respect to its practical application spot test analysis is an analytical technique However there is much more to be said concerning it if it is viewed from a scientific standpoint Its development is linked with studies of the analytical usefulness of chemical reactions The results of such research have been of profit not only to spot test analysis but to analytical chemistry in general The benefit has been twofold New tests and methods of determination have resulted and furthermore the knowledge of the scientific bases of analytical chemistry has been deepened Therefore it may be of interest to review the development of spot test analysis to examine its present state and to consider its future prospects It is difficult to establish who was the first person to carry out spot reactions Analytical chemists have long used single chemical tests conducted in drops of solutions on filter paper or on impermeable surfaces The earliest published instance appears to have been given by Schiff¹ He used paper impregnated with silver carbonate to detect uric acid through the formation of a spot of metallic silver This instance of a spot reaction was not known to me when as a student I made my first trials with spot reactions These experiments were inspired by reading the classical studies by Goppelsroeder² who had investigated the capillary rise and spreading the liquids and dissolved materials in filter paper Goppelsroeder was concerned primarily with the capillary separation of organic compounds and he made this the basis of his so called capillary analysis His paper however also contained references to the capillary spreading of inorganic salts Therefore it seemed quite natural to me to find out whether an inorganic capillary analysis was possible If I had known that others before me had had the same idea and that they had found that capillary separation of inorganic materials by means of filter paper is possible in isolated cases only I assuredly would not have busied myself with spot reactions on paper However like many young colleagues I was not yet aware of the importance of literature searches and in this particular case neglect of the printed record proved to be an advantage I had to carry out color reactions in the form of spot tests on the separate zones of the paper in order to detect the materials which had been separated by capillarity It was impossible in these experiments to overlook the fact that the picture of a reaction when carried out as a spot reaction on paper is quite different from that seen in a test tube The appearance of the flecks was quite different according to the concentration of the reaction

partners the variety of the paper and the experimental conditions a finding that hinted at a regularity which was still unknown at the time I was fascinated by the romantic and aesthetic features of the development and outward appearance of the flecks and by the fact that many tests exhibited an unexpectedly great sensitivity when they were conducted as spot reactions on paper My first collaborator R Stern was also fascinated and conceived the idea of trying certain tests with organic reagents in the form of spot reactions We found not only that sensitive individual tests are possible through spot reactions but that several materials can be detected in a single drop of a solution provided the reagents are chosen properly
