Gasoline Low-Pressure Electric Fuel Pump Characterization Gasoline Fuel Injection Standards Committee,2021 This SAE Recommended Practice defines the tests for three basic categories of pump characteristics These are the basic functional performance tests the pump limitation tests and the pump integrity tests The basic functional tests included are three individual tests with the first being for pump speed current draw and electrical resistance The other two individual tests are for the deadhead pressure and the delivered fuel flow rate at the rated delivery pressure and voltage The included tests for pump limitations are individual tests for hot fuel handling cold magnet knockdown load dump transient electrical interference and reverse flow leak The testing for pump integrity includes individual tests for vibration temperature cycling internal fluid compatibility and operational durability These 12 individual tests provide a characterization of the particular pump This document only addresses the in tank mounted electric motor driven low pressure fuel pump itself and does not address in tank pump modules as these modules may include other devices The pumps that are to be tested are intended for the pumping of liquid fuels that are applicable to fuel injected spark ignition engines The SAE J1537 Recommended Practice is fully revised and updated to reflect numerous changes in pump testing procedures as well as new developments in the available technologies Since SAE J1537 was originally published the automotive industry has adopted new test procedures that incorporate emerging technologies and these are all incorporated in this revised document The use of uniform and standardized testing and evaluation procedures for in tank fuel pumps is important to the worldwide automotive community Standardized test procedures provide both fuel pump manufacturers and end users with one accepted test for each of the key fuel pump performance parameters instead of a specialized test protocol for each of many customers and applications The use of these procedures for test configurations testing methods data reduction and reporting that are contained in this document significantly enhance the ability to determine the performance durability and integrity of low pressure in tank gasoline fuel pumps *Distributor Fuel Injection Pump* Robert Bosch GmbH.,1983 **Overhaul of Fuel Pump K-EF**

OHIO COLUMBUS LABS.,U.S. Army Air Mobility Research and Development Laboratory. Eustis Directorate,1971 The
purpose of this program was to develop both the technology and the experimental hardware to experimentally demonstrate
that a main engine fuel pump could be operated at turbine engine shaft speeds A single lobe vane pump has been designed
and successfully operated at speeds up to 49 500 rpm and outlet pressures up to 900 psig while pumping JP 4 turbine fuel
The promosing capabilities demonstrated by this pump were the result of the successful application of hydrodynamic
lubrication techniques to the vane design The pivoting vane tip concept incorporated permits tip surface speeds up to 180 fps
to be achieved without producing high mechanical power losses or sacrificing the pump endurance capabilities The present
experimental fuel pump represents a significant step toward the development of flight hardware capable of operating at
engine shaft speed It meets the basic performance requirements of a main engine fuel pump typically required on small
highspeed gas turbine engines In addition it appears that a variable displacement capability could be developed directly from
the present hardware without altering the established high speed capabilities Author
