The Management Of Lipids In Clinical Practice:

Management of Lipids in Clinical Practice Neil J. Stone, Conrad B. Blum, 2008-11 This book aims to contain in one convenient reference source much of the information needed to manage patients with abnormal blood lipids and lipoproteins. It draws heavily on ATP III and shows how these new guidelines can be incorporated into clinical practice. **Practical Lipid Management** Peter P. Toth, Kevin Maki, 2008-10-13 Lipid management is a key part of medical practice affecting the prevention and treatment of several diseases including diabetes, cardiovascular disease and stroke. A practical text on the clinical management of dyslipidemias, *Practical Lipid Management* balances conceptual development and pathophysiology with a straightforward approach to the identification and treatment of abnormalities in lipid metabolism. The book explores the role of novel risk markers in clinical practice, summarizes the current guidelines for lipid management and offers a critical and systematic approach to interpreting the results of clinical trials. A feature of the book is a set of sidebars which explore current controversies and unanswered questions in clinical lipidology. The treatment of specific dyslipidemias is illustrated with case studies. Treatment algorithms are also provided. *Practical Lipid Management* details the relationship between specific lipids, lipoproteins and cardiovascular disease, provides guidance on the etiology and diagnosis of lipid abnormalities, summarizes current understanding of atherogenesis and reviews the evidence base for the use of therapeutic lifestyle change and specific lipid lowering medications to reduce morbidity and mortality from cardiovascular disease. *Practical Lipid Management* provides a concise summary of best practice according to various international guidelines, making it a useful tool for all primary care physicians and others involved in the management of diseases such as diabetes, cardiovascular disease and stroke. It will serve as an evidence based, rapid and valuable resource for family physicians, internists, nurse practitioners, physician assistants, cardiologists, endocrinologists and allied health professionals involved in the care of patients with lipid disorders. *Dyslipidaemia Clinical Practice* Gilbert Thompson, John Dean, Peter W.F. Wilson, 2001-11-22 After half a century of doubt and debate, dyslipidemia has at last been accepted by cardiologists and the medical community at large as a major treatable cause of atherosclerotic cardiovascular disease. A number of guidelines have been issued on the management of dyslipidemia in preventing coronary heart disease. A working knowledge of the various types of dyslipidemia and their treatment is highly relevant to modern medicine with its accent on prevention. This book, written by a general practitioner, an epidemiologist and a lipidologist, provides a broad and up to date perspective of dyslipidemia and is chiefly intended for use in primary care. It details normal lipid metabolism, describes the genetic and acquired causes of dyslipidemia and reviews the evidence that the latter is a risk factor for vascular disease. Most of the book, however, is devoted to the practicalities of screening, risk assessment and management of dyslipidemia in everyday clinical practice, including chapters summarizing current guidelines, the importance of diet and the role of lipid lowering drugs. Cardiologists, general practitioners and pharmacists will find this volume indispensable. *Nephrocardiology, An Issue of*

Hyperlipidemia Management for Primary Care Brian V. Reamy, 2009-03-01 One of the possible benefits of 30 years of medical practice is the ability to develop some sense of perspective with regard to major transitions in medicine Many physicians who graduated from medical school in the mid to late 1970s may recall feeling less than comfortable about counseling patients regarding lifestyle modification and heart disease risk A total cholesterol of 250 mg% at that time was considered within normal limits The best information on the causation of heart disease came from epidemiologic data showing associations between increased consumption of dairy products and fat in the industrialized countries of northern Europe and America and a corresponding increase in morbidity and mortality from heart disease as compared to other countries that were less well developed or as compared to Mediterranean countries where there was a different type of diet lower in saturated fats and cholesterol Treatment options in those days were based more on anecdotal information and observation than on evidence The idea that coronary artery disease was an inflammatory problem in which the main culprit was oxidized LDL and the idea that heart disease risk could be managed had not yet made the transition to clinical practice This attitude all changed as information from the largest and longest running prospective epidemiologic study on heart disease the Framingham Study began publishing data on causality and risk factors
