Abstract

In order to protect email users from receiving unsolicited commercial email or spam, anti-spam measures building on technologies, such as filters and block lists, have been deployed widely. However, there is some evidence that certain anti-spam measures based on the purported origin of the spam cause unintended consequences related to issues of equity of access, which we term digital redlining. In this article, we revise and expand earlier work looking at secondary effects of anti-spam measures.

Email; Spam; Filtering; Blocking; Digital Divide; Digital Redlining

Introduction

Email is widely regarded as one of the most important services provided by the Internet. In the U.S., Internet users are increasingly choosing email for communication rather than the telephone ([Haythornthwaite & Wellman](#), 2002, p. 6). However, the email communication medium is being threatened by spam (a colloquial substitute for the cumbersome but precise technical expression "unsolicited commercial email" or UCE). A large percentage of email traffic is now made up of spam messages. Telstra BigPond, a major ISP in Australia, reports that 80% of the email they receive is spam ([Hayes](#), 2006). [Li](#) (2006)

Neutrosophy Revisited: Formalizing Core Concepts from Nidus idearum (Book Series) and Related Research Takaaki Fujita, Florentin Smarandache, Uncertainty permeates most real world contexts motivating the need for mathematical frameworks that can faithfully represent vagueness inconsistency and incomplete information Classical approaches to managing these issues include fuzzy sets and intuitionistic fuzzy sets Extending these ideas the neutrosophic framework introduces neutrosophic sets in which each element x is characterized by a triplet of independent degrees representing respectively truth indeterminacy and falsity This book concentrates on a selection of concepts developed and discussed in the Nidus idearum series with particular emphasis on Neutrosophy Plithogenic Sets Physics and related scientific domains The focus is on ideas that despite their conceptual richness and potential applicability have so far received relatively limited systematic treatment The aim is to present these notions in a coherent and accessible manner supporting further theoretical development and encouraging new applications in Neutrosophy Plithogenic Set theory Physics and allied fields *The 446th Revisited* Ed Castens, 199? Introduction to Machine Learning with Applications in Information Security Mark Stamp, 2017-09-22 Introduction to Machine Learning with Applications in Information Security provides a class tested introduction to a wide variety of machine learning algorithms reinforced through realistic applications The book is accessible and doesn't prove theorems or otherwise dwell on mathematical theory The goal is to present topics at an intuitive level with just enough detail to clarify the underlying concepts The book covers core machine learning topics in depth including Hidden Markov Models Principal Component Analysis Support Vector Machines and Clustering It also includes coverage of Nearest Neighbors Neural Networks Boosting and AdaBoost Random Forests Linear Discriminant Analysis Vector Quantization Naive Bayes Regression Analysis Conditional Random Fields and Data Analysis Most of the examples in the book are drawn from the field of information security with many of the machine learning applications specifically focused on malware The applications presented are designed to demystify machine learning techniques by providing straightforward scenarios Many of the exercises in this book require some programming and basic computing concepts are assumed in a few of the application sections However anyone with a modest amount of programming experience should have no trouble with this aspect of the book Instructor resources including PowerPoint slides lecture videos and other relevant material are provided on an accompanying website <http://www.cs.sjsu.edu/stamp/ML> For the reader's benefit the figures in the book are also available in electronic form and in color About the Author Mark Stamp has been a Professor of Computer Science at San Jose State University since 2002 Prior to that he worked at the National Security Agency NSA for seven years and a Silicon Valley startup company for two years He received his Ph D from Texas Tech University in 1992 His love affair with machine learning began in the early 1990s when he was working at the NSA and continues today at SJSU where he has supervised vast numbers of master's student projects most of which involve a combination of information security and machine learning

Struck By Lightning Jeffrey S. Rosenthal, 2014-03-06 Human beings have long been both fascinated and appalled by randomness. On the one hand we love the thrill of a surprise party or the freedom of not knowing what tomorrow will bring. We are inexplicably delighted by strange coincidences and striking similarities. But we also hate uncertainty's dark side. From cancer to bird flu diseases may strike with no apparent pattern. Terrorists attack airplanes, crash bridges collapse, and we never know if we'll be that one in a million statistic. In this entertaining look at the world of probabilities, Jeffrey Rosenthal, maths professor and improvisational comedian, explains the mechanics of randomness in fields as diverse as poker hands, email spam, crime statistics, opinion polls, and lottery jackpots. Read *Struck by Lightning* and chances are you will never look at the world the same way again. *Readings in Virtual Research Ethics* Elizabeth A.
