Tempting Appetizers:

Food cravings Adrian Meule, Boris C. Rodríguez-Martín, 2015-05-26 Food craving refers to an intense desire or urge to consume a specific food. In Western or Westernized societies, these craved foods usually have high palatability and are energy dense, that is, they have high sugar and/or fat content. Accordingly, the most often craved food is chocolate. Food craving is a multidimensional experience as it includes cognitive (e.g., thinking about food), emotional (e.g., desire to eat or changes in mood), behavioral (e.g., seeking and consuming food), and physiological (e.g., salivation) aspects. Experiences of food craving are common, that is, they do not reflect abnormal eating behavior per se. However, very intense and frequent food craving experiences are associated with obesity and eating disorders such as bulimia nervosa and binge eating disorder. The aim of this research topic was to gather new contributions to a variety of aspects of food craving, which include its assessment, cognitive and emotional triggers, moderators, and correlates of food craving, and the relevance of food cravings in clinical issues among others. **The**

Goal Conflict Model of Eating Behavior Wolfgang Stroebe, 2017-10-16 In the World Library of Psychologists series, international experts present career-long collections of what they judge to be their finest pieces: extracts from books, key articles, salient research findings, and their major practical/theoretical contributions. In this volume, Overweight and obesity rates have increased dramatically in most industrialized countries, even though more and more people are chronically dieting. Dieters can manage to lose substantial amounts of weight while actively dieting, but most regain it within a few years. So why do most chronic dieters have such difficulty controlling their weight, and why is there only a small minority of successful dieters? To address these questions, Stroebe developed the goal conflict model of eating behavior, a social cognitive theory that attributes the difficulty of chronic dieters to a conflict between two incompatible goals: eating enjoyment and weight control. Although chronic dieters are motivated to pursue their weight control goal, most fail in food-rich environments. Surrounded by palatable food cues that activate thoughts of eating enjoyment, incompatible weight control thoughts are inhibited, and weight control intentions are forgotten. For successful dieters, probably due to past success in exerting self-control, tasty high-calorie food has become associated with weight control thoughts. For them, exposure to palatable food makes weight control thoughts more accessible, enabling them to control their body weight in food-rich environments. This book contains the key articles of a research program by Stroebe and collaborators to assess the validity of this theory. They succeeded in tracing the processes that lead from temptation to a breakdown of dieting intentions. They also demonstrated that these theoretical principles can be used to develop effective weight loss interventions. The book should be of value for all researchers, students, and clinicians involved in obesity research and treatment. *Food to Grow On* Sarah Remmer, RD, Cara Rosenbloom, RD, 2021-04-13 **TASTE CANADA AWARDS SILVER WINNER** The definitive guide to childhood nutrition, packed with practical advice to support you through pregnancy and up until your little one starts school. *Food to Grow On* gives you the tools to confidently nourish your growing child and set them up with a positive relationship with food for life.
