

Stochastic Approximation for Expectation Objective and Expectation Inequality-Constrained Nonconvex Optimization

1 Introduction

In this paper we consider the constrained optimization problem,

$$\begin{aligned} \min_{x \in \mathbb{R}^n} \quad & F(x), \\ \text{s.t.} \quad & C(x) \leq 0, \end{aligned} \quad (1)$$

where $F : \mathbb{R}^n \rightarrow \mathbb{R}$ and $C : \mathbb{R}^n \rightarrow \mathbb{R}^m$ are (generally nonconvex) continuously differentiable. We assume that this is a stochastic optimization problem wherein for all x , $F(x)$ and $C(x)$ are defined to be expectations of functions that depend on random variables ξ and ζ , respectively, defined on a probability space $(\Omega^f \times \Omega^c, \Sigma^f \times \Sigma^c, P_x)$, i.e.,

$$F(x) = \mathbb{E}_{P_x} [f(x, \xi)], \text{ and } C(x) = \mathbb{E}_{P_x} [c(x, \zeta)]$$

In the sequel we discard, in the notation, the stochastic dependence on P_x . We do not assume any functional form in regards to the dependence of f and c on ξ and ζ . We do allow for dependence between ξ and ζ , in general, however. Thus each noisy function evaluation involves sampling $\sigma \in \Sigma^f \times \Sigma^c$ from the product σ -algebra on the sample space $\Omega^f \times \Omega^c$ based on the probability measure P_x .

As standard for stochastic optimization, this framework is appropriate for large scale instances of learning, where data cannot be stored entirely in memory and mini batch samples must be taken to compute problem information used to calculate the iterate update at each iteration. For instance, a model can be trained on some data while satisfying some maximal loss on another set of data. Alternatively, the optimization problem can define some engineering process that is inherently stochastic and the functions represent its operational performance on some criteria.

We assume, as is standard, that the second moments of the uncertain problem functions are bounded,

$$\begin{aligned} \exists M, \text{ s.t. } \forall x \in \mathbb{R}^n, \mathbb{E}[\|\nabla f(x, \xi)\|^2] &\leq M, \mathbb{E}[\|\nabla c(x, \zeta)\|^2] \leq M, \mathbb{E}[\|c(x, \zeta)\|^2] \leq M, \\ \exists T, M, \text{ s.t. }, \forall t \leq T, x \in \mathbb{R}^n, \mathbb{E}[e^{t\|\nabla f(x, \xi)\|}] &\leq M, \mathbb{E}[e^{t\|\nabla c(x, \zeta)\|}] \leq M, \mathbb{E}[e^{t\|c(x, \zeta)\|}] \leq M, \end{aligned} \quad (2)$$

We are interested in developing a stochastic approximation algorithm for solving (1). The algorithm and convergence theory will be based upon the method and Ghost penalty framework presented in [11]. There it was shown, among other results, that a modified sequential convex

Stochastic Approximation and Nonlinear Regression Arthur E. Albert, Leland A. Gardner, Jr., 2003-02-01 This monograph addresses the problem of real time curve fitting in the presence of noise from the computational and statistical viewpoints. It examines the problem of nonlinear regression where observations are made on a time series whose mean value function is known except for a vector parameter. In contrast to the traditional formulation, data are imagined to arrive in temporal succession. The estimation is carried out in real time so that at each instant the parameter estimate fully reflects all available data. Specifically, the monograph focuses on estimator sequences of the so-called differential correction type. The term differential correction refers to the fact that the difference between the components of the updated and previous estimators is proportional to the difference between the current observation and the value that would be predicted by the regression function if the previous estimate were in fact the true value of the unknown vector parameter. The vector of proportionality factors, which is generally time-varying and can depend upon previous estimates, is called the gain or smoothing vector. The main purpose of this research is to relate the large sample statistical behavior of such estimates, consistency, rate of convergence, large sample distribution theory, asymptotic efficiency, to the properties of the regression function and the choice of smoothing vectors. Furthermore, consideration is given to the tradeoff that can be effected between computational simplicity and statistical efficiency through the choice of gains. Part I deals with the special cases of an unknown scalar parameter, discussing probability one and mean square convergence rates of mean square convergence and asymptotic distribution theory of the estimators for various choices of the smoothing sequence. Part II examines the probability one and mean square convergence of the estimators in the vector case for various choices of smoothing vectors. Examples are liberally sprinkled throughout the book. Indeed, the last chapter is devoted entirely to the discussion of examples at varying levels of generality. If one views the stochastic approximation literature as a study in the asymptotic behavior of solutions to a certain class of nonlinear first order difference equations with stochastic driving terms, then the results of this monograph also serve to extend and complement many of the results in that literature, which accounts for the author's choice of title. The book is written at the first year graduate level, although this level of maturity is not required uniformly. Certainly, the reader should understand the concept of a limit both in the deterministic and probabilistic senses, i.e., almost sure and quadratic mean convergence. This much will assure a comfortable journey through the first fourth of the book. Chapters 4 and 5 require an acquaintance with a few selected central limit theorems. A familiarity with the standard techniques of large sample theory will also prove useful but is not essential. Part II, Chapters 6 through 9, is couched in the language of matrix algebra, but none of the classical results used are deep. The reader who appreciates the elementary properties of eigenvalues, eigenvectors, and matrix norms will feel at home. MIT Press Research Monograph No 42 *Backpropagation* Yves Chauvin, David E. Rumelhart, 2013-02-01 Composed of three sections, this book presents the most popular training algorithm for neural

networks backpropagation The first section presents the theory and principles behind backpropagation as seen from different perspectives such as statistics machine learning and dynamical systems The second presents a number of network architectures that may be designed to match the general concepts of Parallel Distributed Processing with backpropagation learning Finally the third section shows how these principles can be applied to a number of different fields related to the cognitive sciences including control speech recognition robotics image processing and cognitive psychology The volume is designed to provide both a solid theoretical foundation and a set of examples that show the versatility of the concepts Useful to experts in the field it should also be most helpful to students seeking to understand the basic principles of connectionist learning and to engineers wanting to add neural networks in general and backpropagation in particular to their set of problem solving methods

Design Methods of Control Systems D. Franke, F. Recursive Nonlinear Estimation Rudolf Kulhavy, 1996-06-25 In a close analogy to matching data in Euclidean space this monograph views parameter estimation as matching of the empirical distribution of data with a model based distribution Using an appealing Pythagorean like geometry of the empirical and model distributions the book brings a new solution to the problem of recursive estimation of non Gaussian and nonlinear models which can be regarded as a specific approximation of Bayesian estimation The cases of independent observations and controlled dynamic systems are considered in parallel the former case giving initial insight into the latter case which is of primary interest to the control community A number of examples illustrate the key concepts and tools used This unique monograph follows some previous results on the Pythagorean theory of estimation in the literature e g Chentsov Csiszar and Amari but extends the results to the case of controlled dynamic systems
