

An extensive test program led to the development and certification of an optional kit for the 737, including deflation valves on the main and nosewheel legs, an inflation restraint blanket on the underside of the aircraft, protection on the inflator legs and for the hydraulic brake line and the speed brake control valve, strengthening of the VIB, 7360 and ATC controls on the underside of the fuselage and various adaptations of "flow-through" (through-the-engine) bleeders. The difference in the forward-sloping nose wheel is of such design that it cannot be lowered in the normal wheel well and a

deflation valve located in the wheel well is used to release the difference when necessary.

As the 737B, Boeing offered an executive model of the jet early in its development, suggesting various spacious layouts for about 30 passengers. With optional seats that, range of up to 8,000 sq ft of floor area could be achieved. Some of the 737 is an executive site have included the East Corporation and some foreign governments, including those of Egypt, Niger and Venezuela. NASA, which acquired the original company-owned 737-200 in 1975, had its aircraft specially modified to incorporate a second cockpit in the main

passenger cabin, with which the pilot could be separated through forward guidance and control system, while the flight was monitored by check pilots in the flight deck.

History in brief

Boeing took the decision to launch its third jet transport after the 707 and 720 in November 1964, although the formal commitment to put the new type into production had to wait until later when orders were forthcoming. In the event, the point was reached on 15 February 1967 when the German airline Lufthansa announced a contract for 25 Boeing 737s at a price, including spares, of about £2M (the £1.5M contract). The launch decision came after a period of intensive design
