**Supply Chain Optimization through Segmentation and Analytics** Gerhard J. Plenert,2014-04-01

We live in a world where we try to solve similar problems in structurally the same way But they simply are not optimally solved all the same Supply Chain Optimization through Segmentation and Analytics addresses the issue of optimizing the planning and scheduling process and asks the question Is there a one size fits all solution for planning and scheduling The answer is a resounding No We migrated through EOQ MRP JIT and TOC each time hoping to find that one size fits all Each of these systems looked at the facility as if it had one focused problem either optimizing work schedules materials movement or machine utilization But what if you have two or possibly even all three of these problems Then what system do you use Or

what if your critical resource is not labor materials or machinery Then which planning and scheduling solution do you utilize This book introduces the concept of segmentation as the planning and scheduling tool that facilitates the optimization of the supply chain If you have one type of problem in a part of your supply chain you use the solution that appropriately focuses on that problem If you have a different problem in a different part of your supply chain then you use a different and appropriate tool for that part of the supply chain and so forth Or if your product is in different stages of its life cycle it probably requires a different set of tools for each stage of that life cycle In addition the book discusses how to integrate planning and scheduling tools using a segmentation approach that results in a world class supply chain environment It clearly details the power of segmentation and offers a systematic plan for implementation in the supply chain To facilitate this the author covers the components of an integrated segmentation policy including the analytics elements and the measures that define segmentation success He helps you build a strategy and methodology for introducing segmentation principles that allow you to break free from one size fits all thinking

**Network Algorithms for Supply Chain Optimization Problems** Burak Ekşioğlu,2002 ABSTRACT The term supply chain management SCM has been around for more than twenty years The supply chains for suppliers manufacturers distributors and retailers look very different because of the different business functions that they perform and the types of companies with which they deal Thus its definition varies from one enterprise to another We define supply SC as an integrated process where these business entities work together to plan coordinate and control materials parts and finished goods from suppliers to customers For many years researchers and practitioners have concentrated on the individual processes and entities within the SC Recently however many companies have realized that important cost savings can be achieved by integrating inventory control and transportation policies throughout their SC As companies began realizing the benefits of optimizing their SC as a single entity researchers began utilizing operations research techniques to better model SCs Typical models for SC design management problems assume that the involved costs can be represented by somewhat restrictive cost functions such as linear and or convex functions However many of the applications encountered in practice involve a fixed charge whenever the activity is performed plus some variable unit cost which makes the problem more complicated The objective of this research is to model and solve SC optimization problems with fixed charge and piecewise linear concave cost functions In these problems a single item is produced at a set of facilities and distributed to a set of retailers such that the demand is met and the total production transportation and inventory costs are minimized over a finite planning horizon
