**Novel Macromolecular Architectures via a Combination of Cyclodextrin Host/Guest Complexation and RAFT Polymerization** Bernhard V. K. J. Schmidt, 2014-04-21 In this thesis Bernhard Schmidt describes his research into two fields in the chemical sciences supramolecular and macromolecular chemistry Schmidt first investigates cyclodextrins CDs which are well known for the formation of supramolecular host guest complexes with hydrophobic molecules in aqueous solution Schmidt then also examines reversible addition fragmentation chain transfer RAFT polymerization as a well suited toll for the synthesis of water soluble end functionalized polymers The author skillfully combines both concepts as a powerful tool to access reversibly forming macromolecular architectures The novel methods and architectures presented in this work are highly interesting from both a fundamental point of view as well as a basis for the design of efficient drug release systems The work in this thesis has led to a number of publications in top peer reviewed journals Connective Tissue Research, 1989

**Luminescent Cyclodextrin Supramol[e]cular Recognition Sites for Optical Chemosensing** Wanda K. Hartmann, 1997 Polymer Membranes/Biomembranes Wolfgang Peter Meier, Wolfgang Knoll, 2009-12-16

The multicomponent nature of biological membranes and their intracellular interactions make direct investigations on the membrane structure and processes nearly impossible Clearly a better understanding of the membrane properties and the mechanisms determining membrane protein functions is crucial to the implementation of biosensors bioreactors and novel platforms for medical therapy For this reason the interest in model systems suitable for the construction and study of complex lipid protein membrane architectures has increased steadily over the years The classical portfolio of model membranes used for biophysical and terfacial studies of lipid bilayers and lipid protein composites includes Langmuir monolayers assembled at the water air interface unilamellar and multilamellar vesicles in bulk liposomal dispersion bimolecular lipid membranes BLMs and various types of solid supported membranes All these have specific advantages but also suffer from serious drawbacks that limit their technical applications Polymer membranes comprised of entirely synthetic or hybrid synthetic polymer biopolymer block copolymers appeared to be an attractive alternative to the lipid based models Generally the synthetic block copolymer membranes are thicker and more stable and the versatility of polymer chemistry allows the adoption of relevant properties for a wide range of applications This volume provides a vast overview of the physicochemical and synthetic aspects of artificial membranes Numerous membrane models are described including their properties i.e. swelling, drying, lateral mobility, stability, electrical conductivity, etc. advantages and drawbacks The potential applications of these models are discussed and supported by real examples Chapter 1 summarizes methods for the stabilization of artificial lipid membranes
