**Active Screen Plasma Surface Modification of Polymeric Materials for Biomedical Application** Xin Fu, 2012 Surface modification of polymers has long been known in polymer chemistry but has not yet been widely applied to biomaterials A newly developed active screen plasma technology has a potential to treat such non conductive materials as polymers to improve their surface properties since this is a low temperature low cost and environmentally friendly plasma process in this project three kind of polymeric materials ultra high molecular weight polyethylene polyurethane and polycaprolacton were surface modified using active screen plasma nitriding technology The results demonstrated that it is feasible to conduct plasma surfae modification of polymeric materials using the newly developed active screen plasma technology without causing any etching significant sputtering or other surface damage

Changes in chemical composition and structure have been found on all three polymeric materials surface following active screen plasma surface treatments. Crosslinking or new functional groups are formed on the topmost surface layer after the treatment. Along with changes in surface morphologies and structural the wettability of the surface of all three polymeric materials can also be effectively improved by the active screen plasma nitriding treatments. Active screen plasma nitriding technique is an effective and practical method to improve osteoblast cell adhesion and spreading on all three polymeric materials surface.

**Surface Engineering of Polymeric Biomaterials** Todorka G Vladkova, 2013-01-10 Biomaterials work in contact with living matter and this gives a number of specific requirements for their surface properties such as bioinertness or bioactivity, antibiofouling and so on. Surface engineering based on physical chemical, physical chemical biochemical or biological principles is important for the preparation of biomaterials with the desired biocontact properties. This book helps the reader gain the knowledge to enable them to work in such a rapidly developing area with a comprehensive list of references given for each chapter. Strategies for tailoring the biological response through the creation of biomaterial surfaces resistant to fouling are discussed. Methods of eliciting specific biomolecular interactions that can be further combined with patterning techniques to engineer adhesive areas in a noninteractive background are also covered. The theoretical basis of surface engineering for improvement of biocontact properties of polymeric biomaterials as well as the current state of the art of the surface engineering of polymeric biomaterials are presented. The book also includes information on the most used conventional and advanced surface engineering methods. The book is targeted at researchers, post doctorates, graduate students and those already working in the field of biomaterials with a special interest in the creation of polymeric materials with improved biocontact properties via surface engineering.

**Laser surface treatment of a polymeric biomaterial:** David Garreth Waugh, Jonathan Lawrence, 2014-02-01 Biotechnology has the potential to improve people's quality of life and holds the key to many unmet clinical needs. In the UK alone the biotechnology market is worth 4.5 billion and estimates of future growth range from 10 to 15%. This growth can only be driven by the increased use of inexpensive and easy to manufacture polymeric biomaterials. Although polymer science is a rapidly developing area of research it remains that one of the most intractable problems encountered in biotechnology is that the performance of polymeric biomaterials depend upon both the bulk and surface properties. In this book the authors describe their work using lasers to modify the wettability characteristics of nylon 6,6 as wetting is often the primary factor dictating the adhesion and bonding potential of materials as a route to enhancing the surface in terms of in vitro osteoblast cell response. What is more, modifying wettability characteristics in this way is shown to be a highly attractive means of estimating the biofunctionality of a polymer. The book demonstrates and explains how the generation of a biomimetic surface on polymers using laser beams provides an in vitro platform on which to deposit

and grow cells for either the development of implants or to reconstitute functional tissue The correlative trends and generic characteristics which are identified in the book between the laser surface treatment wettability characteristics and osteoblast cell response of the nylon 6 6 provide a means to estimate the osteoblast cell response in vivo The book shows clearly that laser surface modification of polymeric materials has tremendous potential for application within the field of regenerative medicine     Chemically Modified Surfaces Joseph J.
