Compact antennas are a subject of growing interest from industry and scientific community to equip wireless communicating objects. The need for high performance small antennas and RF front ends is the challenge for future and next generation mobile devices. This book brings the body of knowledge on compact antennas into a single comprehensive volume. It is designed to meet the needs of electrical engineering and physics students to the senior undergraduate and beginning graduate levels and those of practicing engineers.

*Analysis of Electrically Small Antenna Designs and Limitations* James C. Howell, 2018. Author's abstract: Electronic sizes are constantly decreasing. The need for smaller communication systems is at an all time high. The antenna is a major part of wireless communication systems so the need for smaller antennas is also paramount. Electrically small antennas are the solution to this problem. Electrically small antennas have many inherent limitations. In this thesis a comprehensive background on electrically small antennas is conducted to illustrate the common design limitations that face electrically small antennas. Three novel size reduced antennas are presented in this thesis: A 1/5 element size reduced Yagi Uda antenna, a 1/6 element size reduced antenna and a spherical helix electrically small antenna. All are introduced in this thesis. The antennas are all designed, simulated, fabricated and measured for verification of results.

*Small Antenna Handbook* Robert C. Hansen, Robert E. Collin, 2011-10-25. Now in a completely revised, updated and enlarged Second Edition. *Small Antennas in Portable Devices* reviews recent significant theoretical and practical developments in the electrically small antenna area. Examining antenna designs that work as well as those that have limitations, this new edition provides practicing engineers and upper level and graduate students with new information on work on improving bandwidth using spherical helix dipoles, work on electromagnetically coupled structures, exact derivation of the Q for electrically small antennas for both the TE and TM modes and a new simplified Q formula.

**Analysis and Design of Electrically Small Antennas for Non-line-of-sight Communications** Sungkyun Lim, 2007. As the demand for compact portable communication electronics increases, the technology of miniaturization has made great progress. A beneficiary of that progress has been research into new concepts for the antenna, one of the essential components in wireless communications. As the size of an antenna becomes smaller, however, the antenna suffers from high Q and low radiation resistance. The results are narrow bandwidth, poor matching, low efficiency and more generally poor performance throughout the communication system. First, the design of a small antenna for HF/VHF communications is described. As the operating frequency of an antenna decreases, for example, into the HF and low VHF regions, the physical size of the antenna becomes a critical issue. It is desirable to design a truly electrically small antenna by reducing the ground plane size. Moreover, when the antenna size is very small, the bandwidth of the antenna is extremely narrow, which is critical to various deployment variances and propagation effects such as multi-path fading. The new design, which is an inductively coupled top loaded monopole structure optimized by a genetic algorithm (GA), maximizes transmission of HF/VHF waves. Electrically small spiral ground planes for the monopole and the electrically small antenna are designed for HF ground wave transmission. In addition, a

tunable small antenna is investigated that overcomes the narrow bandwidth limitation of electrically small antennas. Second new design methodologies for electrically small antennas are discussed. Use of an inductively coupled feed is one of the well known methods for boosting input resistance. As the antenna size becomes smaller however it is found that the efficiency of an antenna using an inductively coupled feed is lower than an antenna using multiple folds. After a comparison of the two methods the design of a thin multiply folded electrically small antenna is proposed for achieving high efficiency in a physically compact size. The GA is used to assess the effect of geometry on the performance in terms of efficiency and bandwidth of the electrically small antennas including the folded conical helix and folded spherical helix. Finally the prospects of using the new Yagi antennas to achieve small size are explored. Yagi antennas are used widely to obtain high gain in a simple structures. The antenna is composed of the driven element and the parasitic elements which include a reflector and one or more directors. Typically sufficient spacing on the order of  $0.15\lambda$  to  $0.4\lambda$  between the driven element and the parasitic elements is needed for the Yagi antenna to operate well. For some applications however it is desirable to reduce the spacing and the length of the elements to achieve a physically more compact size. In this dissertation closely spaced folded Yagi antennas in both three dimensions and two dimensions are investigated and a design for an electrically small Yagi antenna is suggested.

Antenna Theory and Design Warren L. Stutzman, Gary A. Thiele, 1998. Highly respected authors have reunited to update the well known 1981 edition which is still hailed as one of the best in its field. This edition includes recent antenna innovations and applications. It features a succinct treatment of the finite difference time domain (FDTD) computational technique. It is also the first text to treat physical theory of diffraction (PTD).

Antenna Engineering Handbook John Volakis, 2018-11-05. The gold standard reference on the design and application of classic and modern antennas, fully updated to reflect the latest advances and technologies. This new edition of the bible of antenna engineering has been updated to provide start to finish coverage of the latest innovations in antenna design and application. You will find in depth discussion of antennas used in modern communication systems, mobile and personal wireless technologies, satellites, radar, deployments, flexible electronics, and other emerging technologies including 5G terahertz and wearable electronics.
