

**EMPID** *Troglodytes*

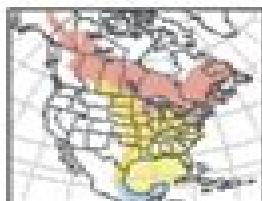

Three of the 14 species of empids found in N.A. These relatively small, drab birds are extremely difficult to identify. Their plumages are characterized by shades of green, brown, buff, and off-white, with darker wings and tails, most have wing bars and eye rings. Most species are long-distance migrants. Males that plumage becomes darker with season.

**YELLOW-BELLIED FLYCATCHER**, *Empidonax flaviventris* 100% = 1

Even in migration, these birds favor shady forest interiors. They are usually dominated by their vocalizations as by

their active foraging with tail and wing flicking. Monotropy, L. 5.8" (24) and 100% (100%). Appears short tailed, with a large head and rounded crown that appears slightly peaked at the back, moderate primary projection. Broad-based bill, may appear somewhat large, entirely pale yellow-orange or pink-brown mandible, apex is black. Above shows much more yellow below with a buffy sometimes olive wash on the sides of the breast. Yellow color from the sides of the face blends smoothly into the more yellow throat. Conspicuous bold eye ring is relatively even, often yellowish, and often slightly darker behind eye. Wings appear very black with bright white wing bars (less so on worn birds). When fall migrants are grayer above and paler below, occasionally nearly grayish white below. Males occur in breeding grounds, nest-site similar to spring, white but with bold buffy wing bars.

**SIMILAR SPECIES** Compared to the Acadian Flycatcher, and the Yellow-bellied's smaller size, shows primary projection, smaller bill, shows and narrower tail, olive wash on breast, and much timing. Very worn fall adults approach the Least Flycatcher in appearance, but note the Yellow-bellied's more blunted throat, and

finely pale lower mandible, and call. See the Pacific-slope Flycatcher for differences with that species, see also the Canadian Flycatcher.

**WING** state includes a deep-red-bellied olive, similar to the Acadian's, and a brownish-buff-bellied olive, similar to the Least's, but seldom, brown, not so winged.

**STATUS & DISTRIBUTION** Common, numerous. Northern huge, common, and other damp conditions woods, mountains, Great-Gulf migrant. Less in spring, only in fall (e.g., southern Great Lakes mostly May 15–June 1, early Aug.–late Sept. Western Pacific Mexico to Panama, mainly Great in spring, only in fall in west TX, NM, AZ, NV, and CA.

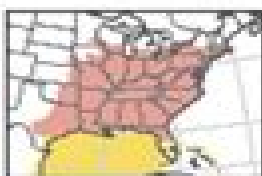

**POPULATION** Stable.

**ACADIAN FLYCATCHER**, *Empidonax acadicus* 100% = 1

The Acadian has a calm, even languorous look, with often-throated wings and a minimum of wing and tail flicking. However, its vocaliza-

tions are defined with force and it frequently perches relatively high in trees. Monotropy, L. 5.5" (24) and 100% (100%). A large empid with long primary projection and a broad tail. There is usually a peak at the back of the head. The bill is the longest of any empid long and broad based with an almost entirely yellowish lower mandible, apex is generally bright olive above and pale below. Usually with pale grayish throat, pale olive wash across upper breast, white lower breast, and face yellowish buff and underlaid corners. Usually narrow, yellowish, and sharply defined eye ring that may be faint on some birds. Quite dark wings with prominent

wing bars. Acadian typically appear very worn by mid-summer, almost white below. Males occur in breeding grounds, nest-site similar to acadian but with bold buffy wing bars.

and more extensive yellow coloration throughout.

**SIMILAR SPECIES** Compared with the similarly structured Alder and Willow Flycatchers and the smaller Yellow-bellied and Least Flycatchers.

**WING** state, similar to the first pair of its wing, broader and darker than either winged call notes. On breeding grounds, given part-part-part-part. Rather like, but rather, some. An empid, 100% wing.

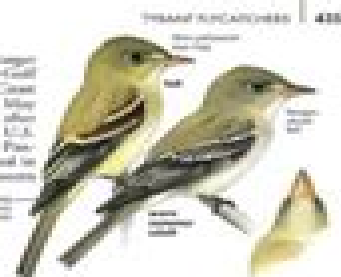

**STATUS & DISTRIBUTION** Common.

**ALDER FLYCATCHER**, *Empidonax albertus* 100% = 1

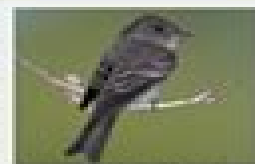

Until the early 1970s, the Alder Flycatcher was considered the same species as the Willow Flycatcher. Even today, Alder are often not separable from common Willow without hearing their distinctive vocalizations. Many birders often confuse birds of this species pair by their old names, the "Willow" Flycatcher. Alder do not do

much better. Many have, perhaps larger throat, numerous. Mostly Great-Gulf migrant. In spring, southern Great Lakes, May 15–20, in fall, migrants quickly after molting, July–late Sept., are in U.S. after early Oct. numerous. Mostly Pacific to Canada, numerous. Great in QC, NB, and NS. Less likely common, mostly in Wyo. Acadian in NM, AZ, SE, and BC.

**POPULATION** Stable.

**Identification of an Empid**

First, make sure you are really looking at an empid. Empidiforms are frequently confused with woodpeckers and are best separated by structure and behavior. Empidiforms are active birds that frequently change positions and flick their wings or tail, whereas woodpeckers will sit for long periods of time. While they may spread their wings and tail when landing or to prey, they do not engage in the quick flicks that are characteristic of empids. As can be seen on this Wilson's Wood Pewee, greenish-gray birds have longer wings. To have Empidiforms, which birds that have been identified by wing on the breeding grounds. Watch them for long periods of time under a variety of lighting conditions, and look at many different individuals. Pay attention to the exact shape of the bill. Some species (e.g., the Willow) have broad bills, while others (e.g., the Hammond's) have narrow bills. The pattern of the lower mandible is often important: the Hammond's lower mandible is mostly dark, the Least's is mostly pale. Finally the wings, particularly the primary projection. Common species tend to have brighter ventral edges and wing bars.

Wilson's Wood Pewee (CA, May)

Hammond's Flycatcher (CA, Aug.)

Quality Flycatcher (AZ, Feb.)

Willow Flycatcher (CA, May)

Note the Hammond's primary projection is longer than the Least's. The ring, throat color, and appearance coloration are also important. Look at any vocalizations, particularly call notes. Appearance (e.g., bill color)

changes based on age, sex, and season, as well as individual variation. Breeding habits is also important. Most importantly, remember that some individuals appear intermediate and others are poorly seen. ■
