Perspectives in Avian Skeletal Systems and Skeletal Abnormalities Chongxiao (Sean) Chen, Anthony Pokoo-Aikins, Prafulla Regmi, Shu-cheng Huang, Mujeeb Ur Rehman, 2023-10-16 The avian skeletal system is drawing increasing attention from researchers because it serves as a unique research model to study bone metabolism and pathologies as well as the importance of bone health and its relationship with animal productivity and welfare. The avian skeleton is a delicate system providing structural support to the bird and minerals for eggshell formation meanwhile functioning as an immune organ. There is a lack of complete understanding of the physiological difference between mammalian and avian bones the impact of genetic improvements the interaction between immunity and bone health the avian bone 3D structural development and turnover the biological function of avian bone and its relationship with animal well being. Additionally skeletal abnormalities can have a serious effect on poultry farming whereby conditions such as osteomyelitis rickets and chondrodystrophy among others can cause changes in gait patterns reduced walking ability and other pathophysiologies with subsequent detrimental effects on feed conversion and growth as well as economic losses

Molecular Mechanisms of Dementia Wilma

Wasco, Rudolph Tanzi, 1996-11-01 The past decade has witnessed a revolution in the attempts of scientists to understand the molecular basis of dementia. Although dementia as defined by global cognitive decline involving gradual loss of memory, reasoning, judgment, and orientation presents most commonly in the form of Alzheimer's disease (AD), an assortment of other less common disorders such as prion and Pick's disease can also lead to symptoms that are similar to those observed in patients with AD. The primary goal of Molecular Mechanisms of Dementia is to address the various mechanisms and multi-faceted approaches currently being employed to more clearly delineate the etiological and pathogenic events responsible for the onset of dementia. Perhaps the greatest boon to obtaining a clearer understanding of the causes of AD has come from genetic and molecular biological studies carried out over the past decade. At the genetic level it has become increasingly clear that AD is a heterogeneous disorder that can be broadly classified into two categories. Late onset (60 yr) cases which account for the vast majority of AD genetically involve susceptibility genes representing risk factors for the disease e.g. inheritance of the 84 allele of the Apolipoprotein E gene. In many cases the susceptibility gene can act as a modifier that modulates the pathogenic cascade occurring subsequent to a separate etiological event initiating or causing the disorder.
