It is self-contained and with no prerequisites, it focuses on elementary knowledge and thinking models. The content has been tested in university classrooms for over six years and has been used in summer schools to train university and high school teachers on teaching introductory computer science courses using computational thinking. This book introduces computer science from a computational thinking perspective. In computer science, the way of thinking is characterized by three external and eight internal features, including automatic execution, bit accuracy, and abstraction. The book is divided into chapters on logic thinking, algorithmic thinking, systems thinking, and network thinking. It also covers societal impact and responsible computing material from ICT industry to digital economy, from the wonder of exponentiation to the wonder of cyberspace, and from code of conduct to best practices for independent work. The book's structure encourages active hands-on learning using the pedagogic tool Bloom's taxonomy to create computational solutions to over 200 problems of varying difficulty. Students solve problems using a combination of thought experiment, programming, and written methods. Only 300 lines of code in total are required to solve most programming problems in this book. *Space Studies Board Annual Report 2014* National Research Council, Division on Engineering and Physical Sciences, Space Studies Board, 2015-04-10. Big Data in Cognitive Science Michael N. Jones,2016-11-03 While laboratory research is the backbone of collecting experimental data in cognitive science a rapidly increasing amount of research is now capitalizing on large scale and real world digital data Each piece of data is a trace of human behavior and offers us a potential clue to understanding basic cognitive principles However we have to be able to put the pieces together in a reasonable way which necessitates both advances in our theoretical models and development of new methodological techniques The primary goal of this volume is to present cutting edge examples of mining large scale and naturalistic data to discover important principles of cognition and evaluate theories that would not be possible without such a scale This book also has a mission to stimulate cognitive scientists to consider new ways to harness big data in order to enhance our understanding of fundamental cognitive processes Finally this book aims to warn of the potential pitfalls of using or being over reliant on big data and to show how big data can work alongside traditional rigorously gathered experimental data rather than simply supersede it In sum this groundbreaking volume presents cognitive scientists and those in related fields with an exciting detailed stimulating and realistic introduction to big data and to show how it may greatly advance our understanding of the principles of human memory perception categorization decision making language problem solving and representation
