**Evolutionary Biology of Tumor Initiation and Progression**

Yusuke Suenaga,Erich Bornberg-Bauer ,Mamoru Kato,2024-06-28 Cancer is characterized by heterogeneous cells with capacity for self renewal and selective pressures in the microenvironment which constantly change the cell population This descent with modification is consistent with Darwin s definition of evolution and accordingly cancer progression can be captured from an evolutionary angle However there is also a clear difference between cancer progression and biological evolution First contrary to the evolution of complex organisms cancer originates from cells of multicellular organisms that escape their constraints and behave like unicellular organisms Therefore from the beginning cancer cells have complex genomes that contain abundant genetic materials which they can use to change their phenotype by dynamic rearrangements and modifications Secondly epigenetic effects promote cancer evolution in contrast to the evolution of life Some tumors develop with minimal genetic alterations and cell plasticity contributes to both initiation and progression in various tumors However an evolutionary theory that encompasses these characteristics of cancer remains to be developed

**Sustainability and Energy Management of Cities for Improved Health and Well-Being** González-Lezcano, Roberto Alonso, 2022-04-29 Global environmental challenges such as climate change rapid urbanization and human influence on the environment continue to grow. Many of these resulting risks lead to diseases and negative impacts on health and quality of life. It is now essential to develop more sustainable and healthy environments with greater focus on prevention by targeting the root causes of disease. Urban communities comprise a high concentration of services consumption and waste and represent an unsustainable pattern of urbanization that accelerates the decline of global ecosystems services rather than supporting them through the compensatory contributions of peri urban and rural areas. By focusing on reducing environmental and social risk factors almost a quarter of the global burden of disease can be avoided through better health promotion strategies and improved prevention and hygiene measures. **Urban Sustainability and Energy Management of Cities for Improved Health and Well Being** highlights the interdisciplinary connections between the environment and human health focusing on new ideas and suggestions for promoting both sustainable development and human health and well being. It creates a new approach to the analysis of human impacts on the natural environment and conversely determines how the environment can modulate human lifestyles and health. Furthermore this book explores opportunities and challenges urban communities face as they seek to become sustainable systems embedded in their diverse and complex social and environmental contexts. Covering topics such as affordable housing ecological waste materials and urban health this premier reference source is an essential resource for environmentalists civil engineers government officials architects libraries students and educators of higher education urban planners researchers and academicians
