Advanced Aircraft Flight Performance Antonio Filippone, 2012-12-17 This book discusses aircraft flight performance focusing on commercial aircraft but also considering examples of high performance military aircraft. The framework is a multidisciplinary engineering analysis fully supported by flight simulation with software validation at several levels. The book covers topics such as geometrical configurations, configuration aerodynamics and determination of aerodynamic derivatives, weight engineering, propulsion systems, gas turbine engines and propellers, aircraft trim, flight envelopes, mission analysis, trajectory optimisation, aircraft noise, noise trajectories and analysis of environmental performance. A unique feature of this book is the discussion and analysis of the environmental performance of the aircraft focusing on topics such as aircraft noise and carbon dioxide emissions.

The Design of Aircraft Landing Gear Robert Kyle Schmidt, 2021-02-18 The aircraft landing gear and its associated systems represent a compelling design challenge simultaneously a system a structure and a machine. It supports the aircraft on the ground, absorbs landing and braking energy, permits maneuvering and retracts to minimize aircraft drag. Yet as it is not required during flight, it also represents dead weight and significant effort must be made to minimize its total mass. *The Design of Aircraft Landing Gear* written by R. Kyle Schmidt PE B.A.Sc. Mechanical Engineering M.Sc. Safety and Aircraft Accident Investigation Chairman of the SAE A 5 Committee on Aircraft Landing Gear is designed to guide the reader through the key principles of landing system design and to provide additional references when available. Many problems which must be confronted have already been addressed by others in the past but the information is not known or shared, leading to the observation that there are few new problems but many new people. *The Design of Aircraft Landing Gear* is intended to share much of the existing information and provide avenues for further exploration. The design of an aircraft and its associated systems including the landing system involves iterative loops as the impact of each modification to a system or component is evaluated against the whole. It is rare to find that the lightest possible landing gear represents the best solution for the aircraft; the lightest landing gear may require attachment structures which don't exist and which would require significant weight and compromise on the part of the airframe structure design. With those requirements and compromises in mind, *The Design of Aircraft Landing Gear* starts with the study of airfield compatibility, aircraft stability on the ground, the correct choice of tires followed by discussion of brakes, wheels and brake control systems. Various landing gear architectures are investigated together with the details of shock absorber designs, Retraction kinematics and mechanisms are studied as well as possible actuation approaches. Detailed information on the various hydraulic and electric services commonly found on aircraft and system elements such as dressings, lighting and steering are also reviewed. Detail
