Iterative Learning Control Zeungnam Bien,Jian-Xin Xu,2012-12-06 Iterative Learning Control ILC differs from most existing control methods in the sense that it exploits every possibility to incorporate past control information such as tracking errors and control input signals into the construction of the present control action There are two phases in Iterative Learning Control first the long term memory components are used to store past control information then the stored control information is fused in a certain manner so as to ensure that the system meets control specifications such as convergence robustness etc It is worth pointing out that those control specifications may not be easily satisfied by other control methods as they require more prior knowledge of the process in the stage of the controller design ILC requires much less information of the system variations to yield the desired dynamic behaviors Due to its simplicity and effectiveness ILC has received considerable attention and applications in many areas for the past one and half decades Most contributions have been focused on developing new ILC algorithms with property analysis Since 1992 the research in ILC has progressed by leaps and bounds On one hand substantial work has been conducted and reported in the core area of developing and analyzing new ILC algorithms On the other hand researchers have realized that integration of ILC with other control techniques may give rise to better controllers that exhibit desired performance which is impossible by any individual approach

Real-time Iterative Learning Control Jian-Xin Xu, Sanjib K. Panda, Tong Heng Lee, 2008-12-12 Real time Iterative Learning Control demonstrates how the latest advances in iterative learning control ILC can be applied to a number of plants widely encountered in practice The book gives a systematic introduction to real time ILC design and source of illustrative case studies for ILC problem solving the fundamental concepts schematics configurations and generic guidelines for ILC design and implementation are enhanced by a well selected group of representative simple and easy to learn example applications Key issues in ILC design and implementation in linear and nonlinear plants pervading mechatronics and batch processes are addressed in particular ILC design in the continuous and discrete time domains design in the frequency and time domains design with problem specific performance objectives including robustness and optimality design in a modular approach by integration with other control techniques and design by means of classical tools based on Bode plots and state space
