Sol-Gel Science C. Jeffrey

Brinker, George W. Scherer, 2013-10-22 Sol Gel Science The Physics and Chemistry of Sol Gel Processing presents the physical and chemical principles of the sol gel process. The book emphasizes the science behind sol gel processing with a chapter devoted to applications. The first chapter introduces basic terminology, provides a brief historical sketch and identifies some excellent texts for background reading. Chapters 2 and 3 discuss the mechanisms of hydrolysis and condensation for nonsilicate and silicate systems. Chapter 4 deals with stabilization and gelation of sols. Chapter 5 reviews theories of gelation and examines the predicted and observed changes in the properties of a sol in the vicinity of the gel point. Chapter 6 describes the changes in structure and properties that occur during aging of a gel in its pore liquor or some other liquid. The discussion of drying is divided into two parts with the theory concentrated in Chapter 7 and the phenomenology in Chapter 8. The structure of dried gels is explored in Chapter 9. Chapter 10 shows the possibility of using the gel as a substrate for chemical reactions or of modifying the bulk composition of the resulting ceramic by performing a surface reaction such as nitridation on the gel. Chapter 11 reviews the theory and practice of sintering, describing the mechanisms that govern densification of amorphous and crystalline materials and showing the advantages of avoiding crystallization before sintering is complete. The properties of gel derived and conventional ceramics are discussed in Chapter 12. The preparation of films is such an important aspect of sol gel technology that the fundamentals of film formation are treated at length in Chapter 13. Films and other applications are briefly reviewed in Chapter 14. Materials scientists and researchers in the field of sol gel processing will find the book invaluable.

Handbook of sol-gel science and technology. 1. Sol-gel processing Sumio Sakka, 2005

Since Dr Disiich of Germany prepared a glass lens by the sol gel method around 1970 sol gel science and technology has continued to develop. Since then this field has seen remarkable technical developments as well as a broadening of the applications of sol gel science and technology. There is a growing need for a comprehensive reference that treats both the fundamentals and the applications and this is the aim of *Handbook of Sol Gel Science and Technology*. The primary purpose of sol gel science and technology is to produce materials active and non active including optical, electronic, chemical sensor, bio and structural materials. This means that sol gel science and technology is related to all kinds of manufacturing industries. Thus Volume 1 Sol Gel Processing is devoted to general aspects of processing. Newly developed materials such as organic inorganic hybrids, photonic crystals, ferroelectric coatings, photocatalysts will be covered. Topics in this volume include Volume 2 Characterization of Sol Gel Materials and Products highlights the important fact that useful materials are only produced when characterization is tied to processing. Furthermore characterization is essential to the understanding of nanostructured materials and sol gel technology is a most important technology in this new field. Since nanomaterials display their functional property based on their nano and micro structure characterization is very important.

Topics found in Volume 2 include Sol gel technology is a versatile technology making it possible to produce a wide variety of materials and to provide existing substances with novel properties This technology was applied to producing novel materials for example organic inorganic hybrids which are quite difficult to make by other fabricating techniques and it was also applied to producing materials based on high temperature superconducting oxides Applications of Sol Gel Technology

Volume 3 will cover applications such as Sol-gel ,1989 **Handbook of Sol-gel Science and Technology** Lisa C.
