**CQRS Architecture**  
separates read and write operations for a data store. It enables independent scaling of read and write workloads and optimizes them separately.

**Layered (n-tier) Architecture**  
separates software into logical layers.

**Orchestration Architecture**  
a central coordinator (often called an orchestrator) that directs the interaction between services. The orchestrator is responsible for managing the control flow and data flow between services.

**MVP Architecture**  
derivative of the Model-View-Controller (MVC) pattern, which aims to separate the concerns of data management, user interface, and control flow.

**Event-Driven Architecture**  
promotes the production, detection, consumption of, and reaction to events.

**DDD Architecture**  
focuses on the domain logic and complexity rather than the technology used.

**Microkernel Architecture**  
separates a minimal functional core from extended functionality and customer-specific parts.

**Microservice Architecture**  
This architecture designs a software application as a suite of independently deployable, small, modular services.

**Space-Based Architecture**  
This resolves the issues of data consistency, reliable performance, and scalability for large-scale distributed systems.
